| Artificial Intelligence (AI) studies the science and engineering of making intelligent machines, that is, methods<br>which let machines or software exhibit intelligent behaviour. This course specifically concentrates on interac-<br>tive methods applicable to novel human-computer interfaces and computer games. The course will cover to-<br>pics about problem solving in general, search methods, semantic representation, logic and deduction methods,<br>constraint satisfaction methods, as well as algorithmical approaches to apply these methods to interactive sy-<br>stems. The latter includes the identification of necessary software modules and requirements for AI-enabled sy-<br>stems as well as APIs for building so-called world interfaces. An introduction to inductive learning approaches, in<br>particular Q-I earning and Evolutionary Algorithms concludes the lecture. |   |                                      |                     |                               |                   |  |
| Intended learning outcomes  |   |                                      |                     |                               |                   |  |
| After the course, the students will have a broad understanding of the underlying theoretical models and methods used in interactive Artificial Intelligence. They will be able to implement a prominent variety of these methods, to build their own intelligent interactive applications, and to choose the right software tool for this task.<br><b>Courses</b> (type, number of weekly contact hours, language – if other than German)   |   |                                      |                     |                               |                   |  |
