

Subdivided Module Catalogue for the Subject

Human-Computer Systems

as a Bachelor's with 1 major with the degree "Bachelor of Science" (180 ECTS credits)

Examination regulations version: 2018 Responsible: Faculty of Human Sciences Responsible: Institute of Human Computer Media

Learning Outcomes

German contents and learning outcome available but not translated yet.

Berufsziele

Der Bachelorstudiengang Mensch-Computer-Systeme bildet den ersten Teil der Human- Computer Interaction (HCI) Ausbildung an der Universität Würzburg. Aufgrund der bestandenen Bachelorprüfung wird der akademische Grad eines "Bachelor of Science" ("B.Sc.") verliehen, der einen ersten berufsqualifizierenden Abschluss darstellt. Mit dem Bachelorabschluss besitzen Studierende die grundlegende Qualifikation für Tätigkeiten in Institutionen und in der Privatwirtschaft. Absolventen und Absolventinnen sind durch ihre interdisziplinäre Ausbildung vielseitig einsetzbar und haben sehr gute Berufschancen, beispielsweise

- in der Industrie und der Logistik
- in der Automobil-Branche
- im Öffentlichem Dienst/Behörden
- im Bereich E-Commerce
- in der Medizin und Pflege
- als User Experience Designer, Usability Engineer oder User Experience Consultant im IT-Bereich

Der Bachelorstudiengang legt aber auch die Grundlagen für den Masterstudiengang, der dann wiederum den Grundstein für eine wissenschaftliche und qualifiziert praktische Tätigkeit legt. Im Pflichtbereich des Bachelorstudiengangs erlangen Studierende Wissen über grundlegende Inhalte und wissenschaftliche Konzepte der verschiedenen Teilgebiete der HCI und erwerben fundierte methodische Kenntnisse, wobei technische Expertise gleichfalls eine wichtige Rolle spielt. Dieses Wissen wird durch anwendungsnahe Angebote ergänzt. Im Wahlpflichtbereich haben Studierende die Möglichkeit, je nach ihren persönlichen Interessen Module auszuwählen und zu vertiefen.

Qualifikationsziele

Das Studium der Mensch-Computer-Systeme ist interdisziplinär ausgerichtet und vermittelt neben fachspezifischen Kompetenzen auch Kompetenzen aus der Informatik und der Psychologie. Nach erfolgreichem Abschluss des Studiums verfügen die Studierenden über folgende Kompetenzen:

- 1. Allgemeine Kompetenzen
 - Kritische Reflexion und Einordnung von wissenschaftlichen Erkenntnissen.
 - Schriftliche und mündliche Präsentation erworbener Kenntnisse.
 - Durchführung eigener wissenschaftlicher & angewandter Projekte.
 - Verfassen wissenschaftlicher Texte nach fachlichen Standards.
 - Teamarbeit
- 2. Methodische Kompetenzen
 - Analytisches Vorgehen und Abstraktionsvermögen.
 - Algorithmisches Denken und Konstruieren.
 - Verständnis und Strukturierung komplexer Zusammenhange.
 - Analyse-, Design- und Evaluationsmethoden für Mensch-Computer-Systeme.
 - Versuchsplanung, Datenerhebung und Datenauswertung.
- 3. Inhaltliche Kompetenzen
 - Programmierung und programmiertechnische Verfahren.
 - Softwareentwurf und Softwareanalyse.
 - Schnittstellengestaltung interaktiver Systeme.
 - Interaktionstechniken und -paradigmen.
 - Statistische Verfahren.
 - Physiologische und psychologische Benutzereigenschaften.
 - Technische Grundlagen informatischer Systeme.

• Grundlagen zu Usability, User Experience und Human Factors.

Wissenschaftliche Befähigung

- Die Absolvent:innen verfügen über kritisches Verständnis in verschiedenen Teilgebieten der Mensch- Computer-Systeme inklusive Grundlagen der Psychologie und Informatik das den Stand der Fachliteratur sowie einige vertiefte Wissensbestände auf dem aktuellen Stand der Forschung einschließt.
- Die Absolvent:innen besitzen forschungsmethodisches Wissen und die Fähigkeit, wissenschaftliche Erkenntnisse und ausgewählte Literatur zu vergleichen und einzuordnen und an Beispielen zu vertiefen.
- Die Absolvent:innen sind in der Lage exemplarisch/ unter Anleitung, wissenschaftliche Untersuchungen zu planen, durchzuführen und zu bewerten.
- Die Absolvent:innen können die erworbenen methodischen Fähigkeiten einsetzen, um die Ergebnisse empirischer Untersuchungen auszuwerten, zu interpretieren und Schlussfolgerungen daraus zu ziehen.
- Die Absolvent:innen sind in der Lage, sich mit Hilfe von internationaler Fachliteratur in neue Gebiete einzuarbeiten und selbstständig Literatur für bislang neue Fragestellungen zu recherchieren, zu interpretieren und zu bewerten.
- Die Absolvent:innen sind befähigt, sich in neue Themengebiete der Mensch-Computer- Systeme und Fragestellungen durch die Recherche aktueller Forschungsergebnisse einzuarbeiten. Sie können diese Themen- und Fragestellungen unter verschiedenen Zielsetzungen bearbeiten, darstellen und analysieren.
- Die Absolvent:innen sind in der Lage, Probleme und deren Lösungen zielgruppengerecht und (teilweise auch in englischer oder sonstiger Fremdsprache) aufzubereiten und darzustellen (teilweise auch medienunterstützt) und können ihr Wissen und Verstehen auf Tätigkeit und Beruf anwenden sowie Problemlösungen in ihrem Fachgebiet erarbeiten oder weiterentwickeln.

Befähigung zur Aufnahme einer Erwerbstätigkeit

- Die Absolvent:innen begründen das eigene berufliche Handeln mit theoretischem und methodischem Wissen.
- Die Absolvent:innen können die eigenen Fähigkeiten einschätzen, zudem reflektieren sie autonom sachbezogene Gestaltungs- und Entscheidungsfreiheiten und nutzen diese unter Anleitung, in dem sie ihre Erkenntnisse einem Fachpublikum oder einem Praxispublikum gegenüber darstellen und theoriegeleitet argumentieren.

Persönlichkeitsentwicklung

- Die Absolvent:innen kennen die Regeln guter wissenschaftlicher Praxis und reflektieren ihr berufliches Handeln in Bezug auf diese.
- Die Absolvent:innen sind in der Lage, konstruktiv und zielorientiert in einem Team zusammenzuarbeiten, unterschiedliche und abweichende Ansichten produktiv zur Zielerreichung zu nutzen und auftretende Konflikte zu lösen (Teamfähigkeit).

Befähigung zum gesellschaftlichen Engagement

- Die Absolvent:innen können gesellschaftliche Diskussionen auf der Basis selbst recherchierter objektiver Daten bewerten und angemessen diskutieren.
- Die Absolvent:innen können auf der Basis des erworbenen Wissens im gesellschaftlichen Diskurs begründet Position beziehen.
- Die Absolvent:innen haben die Bereitschaft und Fähigkeit entwickelt, ihre Kompetenzen in partizipative Prozesse einzubringen und aktiv an Entscheidungen mitzuwirken.

Abbreviations used

Course types: $\mathbf{E} = \text{field trip}$, $\mathbf{K} = \text{colloquium}$, $\mathbf{O} = \text{conversatorium}$, $\mathbf{P} = \text{placement/lab course}$, $\mathbf{R} = \text{project}$, $\mathbf{S} = \text{seminar}$, $\mathbf{T} = \text{tutorial}$, $\ddot{\mathbf{U}} = \text{exercise}$, $\mathbf{V} = \text{lecture}$

Term: **SS** = summer semester, **WS** = winter semester

Methods of grading: **NUM** = numerical grade, **B/NB** = (not) successfully completed

Regulations: **(L)ASPO** = general academic and examination regulations (for teaching-degree programmes), **FSB** = subject-specific provisions, **SFB** = list of modules

Other: A = thesis, LV = course(s), PL = assessment(s), TN = participants, VL = prerequisite(s)

Conventions

Unless otherwise stated, courses and assessments will be held in German, assessments will be offered every semester and modules are not creditable for bonus.

Notes

Should there be the option to choose between several methods of assessment, the lecturer will agree with the module coordinator on the method of assessment to be used in the current semester by two weeks after the start of the course at the latest and will communicate this in the customary manner.

Should the module comprise more than one graded assessment, all assessments will be equally weighted, unless otherwise stated below.

Should the assessment comprise several individual assessments, successful completion of the module will require successful completion of all individual assessments.

In accordance with

the general regulations governing the degree subject described in this module catalogue:

ASP02015

associated official publications (FSB (subject-specific provisions)/SFB (list of modules)):

07-Mar-2018 (2018-14)

This module handbook seeks to render, as accurately as possible, the data that is of statutory relevance according to the examination regulations of the degree subject. However, only the FSB (subject-specific provisions) and SFB (list of modules) in their officially published versions shall be legally binding. In the case of doubt, the provisions on, in particular, module assessments specified in the FSB/SFB shall prevail.

The subject is divided into

Contents					

The module provides an introduction to typical scientific research work with a focus on human-computer systems topics. Content includes the use of scientific media (conference proceedings, journals, books, etc.) and the presentation of scientific content. Students search for and analyze scientific publications in relation to a specific research question. Analysis involves identifying relevant content, synthesizing it into coherent arguments, and critiquing it. Students present the results of their analysis to other participants with an oral presentation.

Intended learning outcomes

After participating in the module courses, students will be able to understand relevant information from scientific texts and identify and interpret the important key points. They will be able to summarize these and compare and evaluate them with other results and present the overall results to a specialized audience.

Conter	Contents					

The module provides a comprehensive insight into the contents and methods of human-computer interaction. The entire cycle consisting of design, implementation and evaluation of interactive computer systems is considered. Input/output processing techniques and important and typical interaction metaphors, from text-based input to graphical desktop applications to multimodal interfaces, are introduced and prominent evaluation methods are explained. The module provides insights into basic functioning of modern computer systems as well as basic human capabilities and limitations in cognition (perception, cognition, memory, attention, decision making) and physical ergonomics (anthropometry, biomechanics). Accompanying practical tasks in the exercise teach students typical methods of needs analysis, prototype development and evaluation.

Intended learning outcomes

After participating in the module courses, students have acquired basic professional skills. They remember specific methods and procedures. They are able to identify relevant use-cases and recognize possible issues and tasks and compare different solution options. They are able to solve first prototypical tasks, organize the solution process, implement the individual steps of the solution process, interpret and compare the results.

1 semester undergraduate							
Contents							

In this module, fundamentals of accessibility and inclusive design from a human-computer interaction perspective are covered and practiced. Central topics are design for important target groups (e.g. people with visual impairments, elderly people, people with dementia), methods for estimating exclusion, basic technologies for increasing accessibility, principles of universal design and approaches of inclusive design. The content will be taught interactively and applied in a small accompanying project.

Intended learning outcomes

After participating in the module events, students are able to characterize user groups with diverse abilities and limitations. The students are able to independently compile, summarize and evaluate relevant excerpts from the specialist literature. In the project they generate user-oriented design solutions. They develop their communicative competencies and their own values in relation to their fellow human beings with special needs.

Usability guidelines often sound logical, but their implementation is often more difficult than expected. In this module, students learn basic guidelines for the design of e.g. texts, graphics and forms as well as special guidelines from different application domains e.g. web, natural user interfaces and language interaction and apply them prototypically.

Intended learning outcomes

After participating in this module, students will be able to explain basic rules of good user interface design using examples, recognize typical usage problems, and apply rules to avoid them.

Conter	Contents						

This module is about teaching methods of requirements analysis and the design of user interfaces of interactive products. The methods are introduced in the lecture part of the course. Selected methods are tested by the students on examples in the exercise part of the course. In a team, they develop a product concept and carry out the first phases of a user-centered design process from context of use and requirements analysis to the design of design solutions and a tested low-fidelity prototype

Intended learning outcomes

After participating in the module courses, students are able to apply selected methods for context of use and requirements analysis as well as for the design of human-technology interaction. They will be able to contrast the methods and assess the usefulness of individual methods for specific goals and apply the methods to the design of an interactive system. Project work promotes independent planning, communication and cooperation in groups as well as the ability to resolve conflicts.

Conte	Contents				

Media psychology deals with human experiences and behaviour while interacting with media. Media psychology develops theories and tests these in empirical studies. This introductory module aims to equip students with fundamental knowledge about the subject of media psychology (e. g. traditional media and mass media) as well as its theories, findings, and methods. The module focuses on the introduction to a) the subject itself, theories, and findings of media psychology b) research fields and current problems in media psychology c) methods in media psychology.

Intended learning outcomes

Students should be familiar with central concepts and methods of media psychology. They should have a basic knowledge of the subject-specific questions and should understand the relevance and importance of a psychological perspective as well as the relevance of questions in the field of the social sciences. Thus, a basis is provided for academic work as well as for acquiring practically relevant (vocationally oriented) media skills.

The module provides basic knowledge about methods of gaining knowledge in human-computer systems. These include scientific theoretical basics, identification of questions, formulation of hypotheses, securing suitable measurement methods, selection of research paradigms and data collection methods, as well as evaluation and interpretation of research results. In the exercise, the above points are practiced practically by means of tasks such as smaller experiments, data evaluation and the preparation of a research report.

Intended learning outcomes

After participating in the module courses, students are able to investigate empirical questions in human-computer systems using the appropriate scientific methods. The students are able to reproduce basic terms and methods, formulate and comprehend questions, and decide on and apply suitable survey and evaluation methods. The students are able to critically examine the methods of others and their own work and have knowledge of the structure and writing of scientific reports.

In the lecture, the module for human-computer systems studies teaches fundamentals of psychology in the sub-aspects: Emotional and Motivational Psychology, Social Psychology, Personality and Differential Psychology, and Organizational Psychology. In the exercise, examples are given of how this knowledge can be applied or researched in human-computer interaction.

Intended learning outcomes

After participating in the module courses, the students are able to reproduce the basics of the sub-aspects of psychology and to delineate the individual sub-aspects. Furthermore, the students are able to recognize and evaluate the relevance of the sub-aspects in a human-computer system. The exercise enables the students to present and discuss the contents.

Students work independently on an assigned problem from the research area of human-computer interaction (HCI) and document their results according to scientific standards.

Intended learning outcomes

After participation in the module, participants are able to independently apply scientific methods of human-computer interaction to a thematically defined problem. They recognize and interpret subject-specific questions of the problem. They compare, interpret and evaluate analogous problems and remember the necessary methods to answer them. They organize and implement a structured processing and solution process. They document and illustrate their solution process and interpret the results.

This module is about teaching and applying analytical and empirical evaluation methods for usability and user experience of interactive products. The methods are introduced in the lecture part of the course. Selected methods are tested by the students on examples in the exercise part of the course. Furthermore, the students evaluate two interactive products independently in small groups. The task consists of planning, conducting, evaluating and presenting the results of a usability study and includes a critical comparison of methods.

Intended learning outcomes

After participating in the module courses, students will be able to apply analytical and empirical methods for evaluating interactive products, present them in writing and critically evaluate them. They will be able to plan, conduct and evaluate evaluation studies. From the analysis of the results, they develop suggestions for the revision of interactive products. Through project work in small groups, their general problem-solving ability, communicative competence, cooperation skills and self-competence to develop their own willingness to perform.

Conto	ntc				

In this module, students are introduced to safety-critical and complex work areas in which human factors play a major role (e.g. aviation, acute medicine, traffic). For this purpose, (1) a work area with its specific requirements for the design of the human-machine interface is introduced, (2) current problems and research topics in this area are discussed and (3) possibilities and limits are discussed on applying HCI knowledge and research to solving problems in this domain. Excursions to safety-critical work places are also planned as part of the seminar.

Intended learning outcomes

After participating in this module, students will be able to assess how human-machine interfaces must be designed in context through insight and contacts in safety-critical socio-technical work areas. Furthermore, students will be able to analyze these interfaces from a safety-critical point of view and taking into account work area-specific features, and to incorporate these results into designs of new interfaces. The excursions offer an insight into fields in which internships or project and thesis work are relevant and also represent a potential professional field.

In this module, the content, methods and applications of usability research are taught in depth, i.e. the design of human-computer systems along the criteria of effectiveness, efficiency and satisfaction during use. Examples of application come from industrial use, public and private space.

Intended learning outcomes

After participating in this module, students will be able to name the principles of selected usability methods and domains and will be able to design user interfaces themselves as well as conduct studies to investigate issues in the field of human-system interaction. Furthermore, they are able to explain the advantages and disadvantages of different usability methods, analyze and evaluate empirical studies as well as design solutions.

Duration Module level			Other prerequisite	Other prerequisites		
1 seme	1 semester undergraduate					
Conto	Contents					

This module provides in-depth content, methods and applications of user experience research, i.e. the design of human-computer systems with regard to a good user experience. Examples of application come from the public and private spheres and include, for example, customer satisfaction, persuasive interfaces, aesthetic design and service design.

Intended learning outcomes

After participating in this module, students will be able to name the principles of selected user experience methods and domains and will be able to design user interfaces themselves as well as conduct studies to investigate corresponding questions from the field of human-system interaction. Furthermore, they will be able to explain the advantages and disadvantages of different user experience methods, analyze and evaluate empirical studies as well as design solutions.

Courses (type, number of weekly contact hours, language — if other than German)

S (2)

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

Unless otherwise specified, the following methods can be chosen from for assessment in the specialisations Human-Computer Systems:

- a) written examination (approx. 90 minutes) or
- b) presentation (approx. 20 minutes) and handout (approx. 5 pages) or
- c) presentation of project results (approx. 30 minutes) or
- d) presentation (approx. 45 minutes) or
- e) oral examination of one candidate each (approx. 30 minutes) or
- f) term paper (approx. 10 pages).

Conter	Contents					

The course gives an introduction to univariate and bivariate descriptive statistics and probability theory (descriptive statistics, graphic representations of data, probability theory, Bayes, distributions, binomial test, linear, nonlinear and multiple regression, correlation) as well as statistical methods of evaluation research. The application of computer-based data collection and -analysis is trained in exercises and explicitly tested in the exam.

Intended learning outcomes

Students acquire knowledge of various procedures of descriptive statistics and probability theory and their foundations as well as the ability to select adequate statistical methods for testing empirical questions, perform the procedures correctly with using computer-based data analysis, display the results reasonably and interpret them correctly.

The module provides advanced knowledge of inferential statistics (sampling, estimation principles, confidence intervals, theory of Null hypothesis testing, parametric and nonparametric methods for univariate and bivariate data sets, tests of equivalence, contingency table analysis, analysis of variance). After the principles of statistical data analysis are discussed, computational procedures using computer-based data analysis are trained with examples and tested in the final exam.

Intended learning outcomes

Students possess knowledge of various inferential procedures and their foundations as well as the ability to select adequate statistical methods for testing empirical questions e.g. from evaluation research, perform these correctly, display the results reasonably and interpret them correctly.

The module teaches basic concepts of programming. This includes an introduction to object orientation, procedural programming, data types, and control structures. The lecture teaches the theory with practical examples in the programming languages Java, C, C++ as well as an excursus on scripting languages. In the exercise, students apply the theory practically and develop small to medium-sized, high-quality Java programs.

Intended learning outcomes

After participating in the module courses, students will be able to develop initial, small to medium-sized, highquality Java programs. Students know basic concepts of programming and can apply them.

Design and analysis of algorithms, recursion vs. iteration, sort and search methods, data structures, abstract data types, lists, trees, graphs, basic graph algorithms, programming in Java.

Intended learning outcomes

The students master to independently design algorithms, to describe them precisely and to analyze them. The students know the basic paradigms of the design of algorithms and are able to apply them to practical programs. The students are able to estimate the run time behaviour of algorithms and to prove their correctness.

Conten	Contents					

The module provides fundamental knowledge of the development process of a rendering framework for digital synthesis and manipulation of visual content in the context of interactive 3D computer graphics. This includes light-matter interaction, illumination models, image formats, data representation, mathematical formulations of motion and projections, and texturing techniques. The required activities are performed independently in groups of 3 students. Accompanying exercises, software assignments, and discussions assist students in using typical graphics software packages and languages such as WebGL, OpenGL, GLSL, and/or DirectX, as well as organizing the project as a whole.

Intended learning outcomes

After participating in the module courses, students will be able to independently develop key components for digital synthesis and manipulation of visual content in the context of interactive 3D computer graphics. Students will have a sound understanding of the operation of modern software packages for digital synthesis and manipulation of visual content.

Conten	Contents					

The module teaches basic methods for digital synthesis and manipulation of visual content in the context of interactive 3D computer graphics. This includes principles of modeling light-matter interaction, illumination models, image formats, data representations, the mathematical formulations of motion and projections, and texturing techniques. Theoretical aspects of the ray-tracing and raster pipeline substeps and their extension by algorithmic approaches to interactive image synthesis using computer systems will be taught. The WebGL pipeline will be used to practically illustrate the concepts of modern renderers. Typical application areas for interactive 3D computer graphics are contemporary and novel graphical human-computer interfaces, for example in the areas of virtual and augmented reality, the visualization of complex data in scientific and industrial applications, or the economically growing segment of computer games.

Intended learning outcomes

After participating in the module courses, students know basic concepts of digital synthesis and manipulation of visual content. They can recall, summarize and explain principle methods and implement them.

Conto	Contents					

The module teaches basic requirements, concepts and practical solutions in the field of interactive systems. A special focus is on systems for the realization of human-computer interaction, in which user and computer form a common system in a closed input-output loop and requirements of different degrees of reactivity up to real-time are crucial. Possible examples include classical graphical interfaces, web-based solutions, and virtual and augmented reality systems.

Intended learning outcomes

After participating in the module courses, students are able to identify basic capabilities and properties of today's computer systems with regard to their interactivity and to derive technical measures for their realization. Students will be able to select and evaluate suitable solution approaches and tools for tasks in the field of interactive systems development. Furthermore, students are able to develop alternative approaches for future interactive systems.

Practical experience is a necessary skill for application-oriented aspects of various sciences. This is specifically true for human-computer interaction (HCI) which incorporates engineering as well as empirical work skills. This course assigns a well-defined project or task to (teams of) students which they have to solve largely on their own. The topic will be in the area of human-computer interaction with a strong focus on the engineering, aka computer science, part of HCI.

Intended learning outcomes

At the end of the course, the participants will have gained a good understanding of how to solve a coherent problem, using typical HCI skills. They will have learned how to collaborate with colleagues and to define, distribute and execute individual work packages.

Conten	Contents					

The module provides basic knowledge of the collaborative development process of software. This includes both the creation and execution of requirements analyses, the design of the software architecture, its implementation and evaluation. The necessary activities are carried out independently in groups of 8-10 students. Presentations and discussions help the student groups improve their teamwork skills, become familiar with the required technologies and activities, and organize the project as a whole.

Intended learning outcomes

After participating in the module courses, students are able to develop software collaboratively. They can elicit, specify, analyze, and validate software requirements. Students are able to independently familiarize themselves with new software technologies and frameworks and use them to develop software. In addition to these technical and methodological competencies, students will be able to apply best practices for effective teamwork, such as evaluation methods, communicating expectations, and dealing with problems.

Progra	mming	Course Interface Deve	lopment	-	10-MCS-SPSE-152-m01	
Module	Module coordinator			Module offered by		
holder	holder of the Chair of Computer Science IX			Institute of Computer Science		
ECTS	Meth	od of grading	Only after succ. cor	npl. of module(s)		
10	nume	rical grade				
Duratio	n	Module level	Other prerequisites	Other prerequisites		
1 seme	1 semester undergraduate					
Conten	Contents					

The module provides basic knowledge about the collaborative development process of software with a focus on graphical user interfaces. This includes the creation and execution of requirements analyses, the design of the software architecture, its implementation and the testing of the developed software. The necessary activities are carried out independently in groups of 4-5 students. Presentations, exercises and discussions help the student groups to improve their teamwork skills, to become familiar with the required technologies and activities, and to organize the project as a whole. The technologies used are regularly adapted and currently include Git, HTML, CSS, JavaScript, Java, the Play framework, SQL, JDBC and JUnit.

Intended learning outcomes

After participating in the module courses, students are able to develop software collaboratively. They can elicit, specify, analyze, and validate software requirements. Students are able to independently familiarize themselves with new software technologies and frameworks and use them to develop graphical user interfaces. In addition to these technical and methodological skills, students will be able to apply best practices for effective teamwork, such as evaluation methods, communicating expectations, and dealing with problems.

Courses (type, number of weekly contact hours, language — if other than German)

Ü (4)

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

presentation of project results (approx. 20 minutes) Language of assessment: German and/or English creditable for bonus

Allocation of places

Conten	Contents					

The module teaches techniques and practices for creating high-quality software. Specifically, principles of typical software requirements such as reliability, testability, accuracy, security, reusability, maintainability, and efficiency in terms of runtime behavior and resource consumption are presented and discussed. Programming guidelines and source code examples are used to teach concepts, techniques and tools for creating professional quality code and high quality software products.

Intended learning outcomes

After participating in the module courses, students will be able to recall, summarize, explain, and implement theory and methods for creating high-quality software products. Students will be able to compare, describe, and develop testing techniques and software requirements specifications.

Duration		Module level	Other prerequisit	Other prerequisites		
1 semester		undergraduate				
Contents						

Object-oriented software development with UML, development of graphical user interfaces, basics of databases and object-relational mapping, basics of web programming (HTML, XML), software development processes, unified process, agile software development, project management, quality assurance.

Intended learning outcomes

The students possess basic and theoretical and practical knowledge to design and develop software systems.

Courses (type, number of weekly contact hours, language — if other than German)

V (4) + Ü (2)

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

written examination (approx. 60 to 120 minutes).

If announced by the lecturer at the beginning of the course, the written examination may be replaced by an oral examination of one candidate each (approx. 20 minutes) or an oral examination in groups of 2 candidates (approx. 15 minutes per candidate).

creditable for bonus
