

# Subdivided Module Catalogue for the Subject

# Translational Neuroscience

as a Master's with 1 major with the degree "Master of Science" (120 ECTS credits)

> Examination regulations version: 2022 Responsible: Faculty of Medicine

## **Learning Outcomes**

The Translational Neuroscience program at the Medical Faculty of Würzburg covers the following main areas:

- biological-scientific and clinical-theoretical basics
- constructive work in interprofessional and interdisciplinary teams
- basic, translational and clinical research
- diagnostic tools and therapeutic options

#### Scientific qualifications

- Graduates possess a professionally oriented, science-based education and apply scientific thinking and action in a targeted manner to gain new knowledge in medicine.
- They have a basic understanding of scientific work and use professionally legitimate methods of knowledge and testing procedures.
- They adequately assess the possibilities and limits of scientific knowledge in medicine.
- They critically evaluate scientific approaches and results and take their social responsibility and the well-being of patients into account.
- They are able to conduct systematic literature searches, independently derive new questions, formulate hypotheses and identify suitable research methods and apply these to their own scientific work.
- They comply with the principles of good scientific practice.

#### Qualification for scientific employment

Graduates are prepared for a wide range of fields of action in professional institutions and in the
private sector, for example in the areas of research, health, education and training, the world
of work and culture.

#### **Enabling social engagement**

- They identify the ethical dimensions of scientific activity and deal with ethical challenges appropriately.
- They know and take into account the ethical, legal, societal and socio-economic framework conditions of scientific action.
- They communicate their knowledge and skills to others and apply the principle of lifelong learning.

#### Personality development

- They are capable of self-criticism, recognize their personal limits and can reflect on their responsibility and how they deal with their own mistakes.
- They are aware of the different roles in teams. They are able to recognize problems in working together and to offer constructive criticism, and they are prepared to take on leadership tasks and responsibility depending on the situation.

#### **Abbreviations used**

Course types:  $\mathbf{E} = \text{field trip}$ ,  $\mathbf{K} = \text{colloquium}$ ,  $\mathbf{O} = \text{conversatorium}$ ,  $\mathbf{P} = \text{placement/lab course}$ ,  $\mathbf{R} = \text{project}$ ,  $\mathbf{S} = \text{seminar}$ ,  $\mathbf{T} = \text{tutorial}$ ,  $\ddot{\mathbf{U}} = \text{exercise}$ ,  $\mathbf{V} = \text{lecture}$ 

Term: **SS** = summer semester, **WS** = winter semester

Methods of grading: **NUM** = numerical grade, **B/NB** = (not) successfully completed

Regulations: **(L)ASPO** = general academic and examination regulations (for teaching-degree programmes), **FSB** = subject-specific provisions, **SFB** = list of modules

Other: A = thesis, LV = course(s), PL = assessment(s), TN = participants, VL = prerequisite(s)

#### **Conventions**

Unless otherwise stated, courses and assessments will be held in German, assessments will be offered every semester and modules are not creditable for bonus.

#### **Notes**

Should there be the option to choose between several methods of assessment, the lecturer will agree with the module coordinator on the method of assessment to be used in the current semester by two weeks after the start of the course at the latest and will communicate this in the customary manner.

Should the module comprise more than one graded assessment, all assessments will be equally weighted, unless otherwise stated below.

Should the assessment comprise several individual assessments, successful completion of the module will require successful completion of all individual assessments.

### In accordance with

the general regulations governing the degree subject described in this module catalogue:

#### ASP02015

associated official publications (FSB (subject-specific provisions)/SFB (list of modules)):

#### 22-Dec-2021 (2021-89)

This module handbook seeks to render, as accurately as possible, the data that is of statutory relevance according to the examination regulations of the degree subject. However, only the FSB (subject-specific provisions) and SFB (list of modules) in their officially published versions shall be legally binding. In the case of doubt, the provisions on, in particular, module assessments specified in the FSB/SFB shall prevail.

Conten	Contents					

Students will get a theoretical introduction and amplification of topics in cellular neurobiology. The following topics will be discussed: structure, function, and molecular functional components of the peripheral nerves of the nervous system including its neuronal and non-neuronal cells as well as the neuromuscular endplate, motor behavioral tests in mouse models for motoneuron diseases; functional and morphological analysis of motoneurons and motor endplates, anatomical, cellular/neuronal plasticity at selected brain structures, e.g. hippocampus and cerebellum, molecular and cellular pathomechanisms of neuromotor disorders, optogenetic approaches and their use to understand circuit biology, immunohistochemistry /immunfluorescence in hippocampal/cerebellar slices, confocal microscopy, primary neuron preparations of dorsal root ganglia and hippocampal neurons, mou-

#### **Intended learning outcomes**

Students who successfully completed this module are able to understand and dispose current experimental approaches in neurobiology. They are trained in preparations and recording techniques to study the function and pathomechanisms of neural model systems. The students are able to evaluate clinical aspects of neurobiology with a focus on the molecular, cellular and physiological mechanisms. Additionally, they are able to document, evaluate, and classify their own data that were collected during the lab course. Furthermore, the students can critically reflect their data in the context of the experimental methods used.

Conten	Contents					

Students will get an introduction to the key cognitive, behavioral and brain developmental steps. There will be strong focus on how the computational lens of reinforcement learning models, tightly linked to monoamine transmission and dopamine in particular, can useful to investigate research questions in developmental neuroscience. It will be discussed how developmental neuroscience can be a useful tool to investigate the development of psychiatric conditions, in particular ADHD and substance use problems. The methods focus will be on behavioral experiments, neuroimaging, in particular task-based fMRI, and computational modelling. Students will learn to critically evaluate the role of these techniques. Students will give presentation on the topics based on state-of-the-art research articles.

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into the current scientific state of normal and altered cognition and motivation as well as brain development. Developmental changes of basic cognition and motivation such as working memory, reinforcement learning and emotion processing will be addressed via behavioral and neuroscientific studies. Abnormal development will be explained in the context of the neuropsychiatric disorders such as attention-deficit / hyperactivity disorder, autism, substance use and anxiety / depression. The influences of main monoaminergic neuromodulators, in particular dopamine in the context of reinforcement learning, will be discussed.

Conten	Contents					

Students will get an introduction to basic physics of MRI, in particular the functional MRI signal (so called BOLD response). Different fMRI designs, block vs. event, will be introduced. Students will learn to critically evaluate such design differences. The basic steps for preprocessing fMRI data will be introduced and practiced. Using example data of a block and event design, there will be an introduction and practice session on how to implement a statistical model of task-based fMRI data. Students will give presentation on the topics based on state-of-theart textbooks and research articles or implement analysis code. The course requires the students to use Statistical Parametric Mapping software in Matlab. Previous experience in Matlab is not required but beneficial.

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into the basics principles of functional and structural MRI data collection as well as how to perform data preprocessing and principles of statistical analysis. Behavioral data from an experiment conducted during functional MRI will be analyzed and implemented into the statistical analysis of brain activation of controls and patients. As an outlook, we will touch on opportunities of informing such analysis by computational modeling.

<b>ECTS</b>	Meth	od of grading	Only after succ. co	mpl. of module(s)		
5	nume	rical grade				
Duratio	n	Module level	Other prerequisite	Other prerequisites		
1 semester graduate						
Conten	Contents					

Students will get an introduction to the main conditions in child and adolescent psychiatry as well as to state-of-the-art neuroscientific models of etiology and pathophysiology. There will be a focus on ADHD, anxiety disorders, autism spectrum disorder, substance use disorder, eating disorders as well as conduct problems. Whenever possibility, clinical interviews with patient from our department will be presented to the class. Research approaches in child and adolescent psychiatry will be introduced to the students including clinical trials, functional neuroimaging and transcranial sonography. Students will learn to critically evaluate the role of these techniques. Students will give presentation on the topics based on state-of-the-art textbooks and research articles.

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into neurodevelopmental aspects of child and adolescent psychiatric disorders including clinical symptoms, diagnostic criteria, etiology, pathophysiology and research approaches on ADHD, anxiety disorders, autism spectrum disorder, substance use disorder, eating disorders as well as oppositional defiant and conduct problems. Developmental aspects of neuropsychopharmacology are further discussed and the clinical use will be critically evaluated.

**Courses** (type, number of weekly contact hours, language — if other than German)

V(0) + S(0)

**Method of assessment** (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

a) written examination (30 to 60 minutes, including multiple choice questions) or b) log (approx. 10 to 30 pages) or c) oral examination of one candidate each (30 to 60 minutes) or d) oral examination in groups of up to 3 candidates (approx. 30 to 60 minutes) or e) presentation (20 to 45 minutes)

Language of assessment: English

Conten	Contents					

Brain regions and neurotransmitter systems involved in neuronal networks involved in experiencing anxiety and fear, attentional networks, learning and memory, and their importance for emotionality in humans, analysis of gene variants and their association with various psychiatric disorders and behavioural traits; animal models for psychiatric disorders, gene x environment interaction; neuroadaptive mechanisms as a result of stress exposure during different periods of lifetime; resilience, epistatic load hypothesis, mis match hypothesis, anatomical, cellular/neuronal plasticity at selected brain regions, e. g. hippocampus and amygdala; adult neurogenesis; immunohistochemistry/immunofluorescence using forebrain slices; neuronal reconstructions using the Neurolucida software.

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into current concepts and experimental approaches in psychiatry and especially in the neurobiological basis of the etiopathogenesis and the treatment of psychiatric disorders. They will have been trained in molecular biology methods, e. g. genotyping, gene expression analysis and in various methods studying structural neuronal plasticity of the brain. Additionally, they will have learned how to evaluate and present data in oral and written form that was collected during the lab course. In addition, the students will have learned to critically read scientific publications in the field of neurobiology/neuropsychiatry.

Content: target identification for functional and molecular neuroimaging, basic concepts of radiochemistry, radiolabelling of surrogate markers for PET and SPECT, basic concepts of magnetic resonance imaging, basic concepts of positron emission tomography, single photon emission computed tomography and hybrid devices (PET/ CT, SPECT/CT), anatomic and functional structures of the brain in small animals, anatomic and functional structures in humans and patients with neurodegenerative disorders and dementia, multimodality multiparametric imaging of brain tumours using MR, PET and SPECT.

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into current experimental approaches in neurobiology. They will have been introduced to preparations and recording techniques to study the function and pathomechanisms of neural model systems. The students will have examined clinical aspects of neurobiology with a focus on the molecular, cellular and physiological mechanisms. Additionally, they will have learned how to document their own data that they collected during lab courses. In addition, the students will have learned to critically reflect their data in the context of the experimental methods used.

Module title					Abbreviation
Ion channels					03-TN-IC-152-m01
Module coordinator				Module offered by	
Institu	te of Cli	inical Neurobiology		Faculty of Medicine	
ECTS	Meth	od of grading	Only after succ. con	npl. of module(s)	
5	nume	rical grade			
Duration Module level		Other prerequisites			
1 semester graduate					

#### **Contents**

Students will get a theoretical introduction and amplification of topics in ion channel physiology. The following topics will be discussed: physiological properties of membranes, structure-function relationships of ligand-gated and voltage-gated ion channels and their subfamilies, regulation and pharmacology of ion channels, anatomical expression profiles, developmental regulation, evolution of ion channels, sensory systems, ion channelopathies. The accompanied literature seminars are based on current publications of ion channel structures and physiological aspects to discuss experimental and methodological approaches and with this promoting translational thinking. Using student presentations of current research results, the earned knowledge on ion channels is recessed. The practical session will include whole cell recordings at the electrophysiological setup using transfected cells and primary neurons. Using various neurotransmitters and blocking agents, students will apply their learned knowledge of ion channel physiology and observe the consequences at the functional level.

#### **Intended learning outcomes**

Students who successfully completed this module are able to remind and understand the physiological properties of various ion channel families and their importance for brain physiology. The students are able to classify in a bottom-up approach to put the molecular findings into the context of pathomechanisms in various kinds of channelopathies. They will be trained in recording techniques to study ion channel properties on transfected/injected cell lines as well as primary neurons. With this experience, students are able to evaluate the applicability of electrophysiological recording techniques for various ion channels. Additionally, they are able to critically read, reflect, and present scientific reports in the field of channel physiology.

#### **Contents**

Students will get a theoretical introduction and amplification of topics in clinical neurobiology. The following topics will be discussed: introduction to neurons and glia, ion channels and membrane potential, ion channelopathies, synapses, transmitter release, NMJ, myasthenia gravis, cerebellum, basal ganglia, ataxia and Morbus Parkinson, somatosensory system, touch, pain, schizophrenia and autism spectrum disorders, disorders of cognition, muscle and muscle diseases, anatomy and function of the motor system, spinal reflexes, motoneuron diseases, hippocampus, learning and memory, anterograde amnesia, visual agnosia, cortex and the limbic system, emotions, disorders of conscious and unconscious mental processes, attention, smell and taste and hearing, sleep, EEG, epilepsy, vision and diseases of the visual system. The accompanied literature seminars are based on fundamental and current literature on lecture-relevant topics to discuss experimental and methodological approaches and with this promoting translational thinking. Using student presentations of current research results, the earned knowledge in neurobiology is recessed

#### **Intended learning outcomes**

Students who successfully completed this module are able to remind and understand the current theoretical concepts in neurobiology. Furthermore, students are able to classify clinical aspects of neurobiology with the focus to disease mechanisms at molecular, cellular, and physiological levels. Based on current experimental data evaluation, students are able to critical read and evaluate current publications in neurobiology as well as extract relevant information from recent publications.

**Courses** (type, number of weekly contact hours, language — if other than German)

Conten	ıts	•				

Introduction to neural cells and structures relevant for neuroinflammation (glial cells, myelin, myelin molecules, synapses, nodes of Ranvier), components of the innate immune system I: macrophages and microglial cells, components of the innate immune system II: dendritic cells, NK cells, granulocytes; antigen presentation; lymphatic organs, components of the adaptive immune system: lymphocytes and antigen recognition, the phenomenon of tolerance and autoimmunity, experimental models for neuroinflammation (EAE, cuprizone, EAN); the BBB, clinics, pathogenesis and therapy of multiple sclerosis, role of inflammation in primarily neurological/neurodegenerative disorders (Alzheimer's disease; inherited neuropathies).

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired solid insights into fundamental and disease-relevant aspects of neuroimmunology and neuroinflammation. They will have learned to critically read scientific publications and will have been trained in the ability to extract relevant information from the original scientific literature.

Students will get a theoretical introduction and scientific background from the following topics: antibody-mediated CNS diseases – experimental analysis of auto-antibody function; Lessons on nociceptor function learned from pain genetics; Translational approaches in stroke medicine; Subarachnoid hemorrhage - pathophysiology and translational therapy approaches; Pathophysiology of brain trauma: experimental brain trauma models and their analysis; Neurophysiology of hearing in tumor and trauma; The molecular basis of glioma-biology; Neuroplasticity after CNS damage by brain tumors; Connectomics in neurology; understanding neuronal networks for treatment of tremor syndromes; stem cell based models of movement disorders; basics of electrophysiology in experimental and clinical practice; the molecular basis of myopathies. The accompanied journal clubs are based on fundamental and current literature on lecture-relevant topics to discuss experimental and methodological approaches and with this promoting translational thinking. Students will give presentations and thereby earn and transfer knowledge.

# **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into the current molecular and cellular pathophysiology of diseases prevalent in neurology and neurosurgery. They will understand basic mechanisms of disease in the motor and sensory system and of higher functions. They will understand about brain trauma and brain tumor biology. They will have gained theoretical knowledge about animal models for neurological and neurosurgical diseases and will be introduced into behavioral, neurophysiological, morphological and molecular biological analysis methods. They will have learnt how to raise appropriate bed-to-bench research questions and how to devise study plans. They will learn how to read scientific publications critically and how to extract the relevant data bringing them forward in their own project. In addition, they will have learnt how to record and analyze data and how to present them in oral and written form.

1 semester graduate							

Students will get a theoretical introduction in light microcopy methods in neurobiology and systems neuroscience. Main topics are: Physics of light, building of a standard microscope, objectives, numeric aperture, bright field, phase contrast, fluorescence microscopy, confocal microscopy, resolution, contrast, Airy disc patterns, fluorescent molecules and dyes, image processing, preparation of images for publication, Software: GIMP and Fiji (Image)), imaging of calcium ions, genetically encoded calcium indicators (GCamp), viral techniques, lentiviral vectors, MMLV-based vectors, AAV, rabies virus, new developments in image analysis, deep learning, principles of circuit neuroscience, optogenetics, video-based behavioral analysis.

## **Intended learning outcomes**

Students who successfully completed this module will have acquired distinct knowledge about light & fluore-scence microscopy, in vivo calcium imaging and optogenetic methods in neuroscientific research. Processes of image acquisition, image preparation and image analysis will be introduced. Thus, students will be able to better understand, design and evaluate experiments based on microscopy and modern optical methods in the neurosciences. In short lab visits, the students will learn about principle components of microscopes (e.g. epifluorescence, confocal). The students will learn how these components are used to get better microscopy data. The students will see how molecular tools (e.g. viral vectors) and modern methods (optogenetics, chemogenetics) are used to better understand the anatomy and function of neurons and neural networks. They will acquire the competence to better understand these kind of experiments, to analyse and evaluate them. They will also be able to evaluate methods of systems neuroscience and will be able to theoretically design representative technical approaches. Short student presentations (3 – 4 min) will mediate specific presentation competence with the aim to allow presentation of complex microscopy methods in a focused and understandable way for a heterogeneous expert audience. The overall aim is that students will be able to understand, question, evaluate, recapituale and present light microscopy approaches in neurobiology and system neuroscience.

Conten	Contents					
Cturdon	Ctudents will receive a the exetical introduction and consolidation in tonics of nain processing as well as alinical					

Students will receive a theoretical introduction and consolidation in topics of pain processing as well as clinical pain medicine. Contents include an introduction to nociceptors and their activation via specific ion channels, the pain pathway with its synapses, and the descending pathways. Clinically, the classification of pain and the major primary and secondary pain syndromes are discussed. Pain research will be reflected with the possibilities and limitations of preclinical animal models on the one hand and measurement of pain in patients on the other. A focus will also be on the translation of results from research for the clinic and drug development. The subsequent literature seminar will be based on fundamental and current literature on topics relevant to the lecture to discuss clinical studies, experiments and new methods and thereby promote translational thinking in pain medicine. Presentations of current research results and the connection to the clinic (examination of patients) and multimodal interdisciplinary therapy will be used to deepen the learned knowledge in pain medicine.

# **Intended learning outcomes**

In this course, students will learn about the (patho-) physiology of pain, neuroanatomical structures and pain therapy including interdisciplinary multimodal pain therapy. These include molecular mechanism of pain, studying pain in animals and humans and drug development. How to evaluate studies in "pain" is worked-out by the students in a specific article/topic chosen by the student and presented within in a talk during the course.

Cellular elements of the PN I: origin, development, structure, myelin formation, Cellular elements of the PN II: lesion, regeneration and surgical reconstitution, physiology and pathophysiology, Diseases I: inflammatory (GBS, CIDP, myasthenia; clinic and therapy), Diseases II: diabetes; iatrogenic (e. g. vincristine; clinic and therapy), Diseases III: inherited NPs (including models and attempts for treatment approaches). The literature seminar is based on fundamental literature on lecture-relevant topics to document the experiments underlying our present knowledge in peripheral nerve research.

#### **Intended learning outcomes**

Students who successfully completed this module will have acquired insights into cellular elements of the peripheral nerve, physiology and pathophysiology. The students will have examined clinical aspects of diseases with the involvement of peripheral nerves with a focus on the molecular mechanisms and therapeutical options. Additionally, they will have learned how to evaluate and present data in oral form. In addition, the students will have learned to critically read scientific publications in the field of peripheral nerve diseases and will have been trained in the ability to extract relevant information from the original literature.

Basic knowledge about the characteristics of various psychiatric disorders, the proposed neurobiological basis (e.g. gene by environment interaction) as well as the treatment approaches: Anxiety disorders, somatoform disorders, social interaction disorders, psychotic disorders, attention deficit hyperactivity disorder, substance use disorders, neurodegenerative disorders. Basic knowledge about the genetic and neural mechanisms associated with psychiatric disorders such as gene by environment interaction, anatomical, cellular/neuronal plasticity of selected brain regions, e.g. hippocampus and amygdala and brain regions and neurotransmitter systems involved in the processing of emotions. Basic knowledge about state-of-the-art research methods in the field such as the analysis of gene variants and their association with various psychiatric disorders and behavioral traits, animal models for psychiatric disorders, neuroimaging methods in humans.

#### **Intended learning outcomes**

Students who successfully completed this module will have gained an overview of the characteristics of diverse psychiatric disorders. They will have acquired insights into the neurobiological basis of the etiopathogenesis of these disorders (e. g. which neurotransmitter systems and brain regions are involved), how they are treated and into current concepts and experimental approaches studying these psychiatric disorders.

Conten	Contents					

Each week a high-impact paper from the current literature that describes RNA-based mechanisms contributing to neurodegeneration is jointly analyzed in depth. Emphasis is placed on understanding of novel approaches for investigating RNA. The course organizer will give a short introduction at the beginning of each seminar describing the background for the paper to be discussed. Afterwards, students individually describe the original data and jointly discuss their relevance. Individual topics include: RNA expression, function and localization; RNA dysregulation in neurodegenerative diseases; high-throughput sequencing methods for transcriptome analysis; properties and functions of RNA-binding proteins.

#### Intended learning outcomes

After successful completion of this module, students will have gained a deeper understanding of current RNA-based research in the area of neurodegeneration. This outcome is achieved by a weekly in-depth analysis of a current article in this field. Students will become familiar with many techniques applied in RNA research and will learn how to critically interpret the results in the context of neurodegenerative diseases. By doing so, students will be able to evaluate methodological advances in RNA research and obtain a deeper understanding of the pathomechanisms underlying neurodegeneration. Through discussion and active participation, students will improve their communication and analysis skills.

**Courses** (type, number of weekly contact hours, language — if other than German)

S (o)

**Method of assessment** (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

a) written examination (30 to 60 minutes, including multiple choice questions) or b) log (approx. 10 to 30 pages) or c) oral examination of one candidate each (30 to 60 minutes) or d) oral examination in groups of up to 3 candidates (approx. 30 to 60 minutes) or e) presentation (20 to 45 minutes)

Language of assessment: English

Conten	Contents					

Students will get a theoretical introduction and amplification of topics in biopsychology and cognitive neuroscience. The following topics will be discussed: introduction to biopsychological research methods (behavioral assessments, eye-tracking, autonomic psychophysiology, electroencephalography, structural and functional magnetic resonance imaging), emotion and motivation, learning and memory, attention, perception, cognitive control, clinical aspects (e.g., anxiety disorders, depression, addiction). The accompanying seminars are based on fundamental and current literature on lecture-relevant topics to discuss experimental and methodological approaches and with this promoting translational thinking. Using student presentations of current research results,

the acquired knowledge in biopsychology is recessed.

#### **Intended learning outcomes**

Students who successfully completed this module are able to remind and understand the current theoretical concepts in biopsychology and cognitive neuroscience. Furthermore, students are able to describe and interpret biopsychological data and they can select appropriate non-invasive techniques to address specific psychological research questions. They are familiar with general psychological concepts and know about their biological basis. Based on this knowledge, students are able to critical read and evaluate current publications in biopsychology and cognitive neuroscience and can extract relevant information from recent publications.

Conten	Contents					

Students who successfully completed this module will have acquired knowledge of and expertise in probability theory, frequentist statistics in a linear model framework. Topics covered will be: What is statistics, what are data, Intro to R, data wrangling, data visualization, probability, sampling, hypothesis testing, t-tests, ANOVA, regression, (generalized) linear (mixed) model, reproducible research, advanced (bio-)statistical methods. In addition, students will learn the statistical programming language R. At the end of the seminar, they will be able to wrangle and visualize data, carry out different statistical analyses, and write a report in R and RMarkdown.

#### **Intended learning outcomes**

Students who completed this module will have acquired important research skills: They will be able to independently develop a data analysis plan and generate a report using R. Specifically, they will know and remember different types of analysis, will be able to interpret results of these analysis, and implement the analysis in R. In addition, they will be able to identify which analysis is suitable for a given data set, differentiate between analyses, and critically evaluate the results. Furthermore, they will gain methods competence by learning how to program using the statistical programming language R. Using RMarkdown, they will be able to generate a reproducible report. The students will have gained increased social- and self-competencies by cooperating on the class report and increased self-efficacy in the application of statistical analysis.

5	(not)	successfully completed				
Duratio	n	Module level	Other prerequisites			
1 semester graduate						
Conten	Contents					

Besides a detailed theoretical introduction to the means of electrophysiological brain recording in human and animal models, this module will allow to apply analysis to these different types of data. It will focus on temporal analysis of electrophysiological signals but also on a frequency based analysis, i.e. oscillatory brain activity, which plays a crucial role in low-level as well as higher-level cognitive functions. Different electrophysiological responses to simple visual input will be compared between analysis approaches and data type.

#### **Intended learning outcomes**

This module will give a detailed theoretical and practical insight into different electrophysiological recording techniques and the resulting data obtained in human and animal brain recordings. Through hands-on analysis experience with such data, namely multi-electrode recordings, ECoG recordings and EEG/ MEG recordings, the module will allow students to learn analysis techniques and understand the information content of these different kinds of electrophysiological data. The recording and analysis methods introduced can build a bridge from spikes to the local field, from human to the animal model, from invasive to non-invasive approaches and will therefore stimulate translational thinking.
