Subdivided Module Catalogue
for the Subject
Satellite Technology
as a Master’s with 1 major
with the degree "Master of Science"
(120 ECTS credits)

Examination regulations version: 2018
Responsible: Institute of Computer Science
Course of Studies - Contents and Objectives

The Faculty of Mathematics and Computer Science of JMU offers the elite Satellite Technology programme (hereafter: SaTec) as a research-based course leading to the degree of ‘Master of Science’ (MSc) in the framework of the Elite Network of Bavaria. The language of instruction is exclusively English.

In the framework of the SaTec programme in the Elite Network of Bavaria, students acquire the special knowledge and skills needed to be able to apply interdisciplinary contents from physics, computer science, geosciences, electrical engineering, mathematics, natural and engineering sciences in the field of aerospace engineering to solve complex tasks; a particular focus is small, nano and pico satellites.

The common language of aerospace research at international level is English: Subsystems, data sheets and other aerospace materials are developed and compiled in English; as a rule, international research groups and networks use English as their working language and symposia and conferences are held in English. In addition, a large proportion of specialist literature is only available in English. It is highly probable that graduates will later work in an English-speaking environment, for example the common language of launch operators in satellite control centres is English. It is therefore imperative that graduates of the programme feel fully at home with the English language and the respective technical terminology. To this end, the programme is run entirely in English.

Since aerospace engineering demands an innovative and interdisciplinary approach, the SaTec programme in the Elite Network of Bavaria brings together highly talented applicants from a heterogeneous target group and researchers from throughout the world.

Having successfully completed the programme, graduates possess the following skills and knowledge:

- An overview of the interrelationships in the field of aerospace engineering and its areas of application;
- The ability to utilise subject-specific content and apply scientific methods and findings;
- The specialist knowledge required for the transition to professional or research practice; for example they can:
  - Analyse satellite orbits, model constraints and perturbations and design orbits for missions;
  - Plan and develop a space mission from analysis and design to implementation. They are able to define mission constraints and use these as the basis for designing and developing the necessary satellite subsystems;
  - Integrate payloads (sensors and instrumentation) in a satellite mission;
  - Implement control algorithms for satellite attitude control and orbit control within the mission constraints;
  - Plan telecommunication under different time-delay constraints and implement corresponding protocols for the remote operation of space probes from Earth;
  - Design and develop various aerospace systems (such as satellites for remote observation, landing devices for other planets, planetary rovers for surface exploration, small, nano and pico satellites); and
  - Implement aerospace engineering applications in practice for tasks in the areas of Earth observation, planetary exploration and astronomy as well as telecommunication.
Abbreviations used

Course types: E = field trip, K = colloquium, O = conversatorium, P = placement/lab course, R = project, S = seminar, T = tutorial, Ü = exercise, V = lecture

Term: SS = summer semester, WS = winter semester

Methods of grading: NUM = numerical grade, B/NB = (not) successfully completed

Regulations: (L)ASPO = general academic and examination regulations (for teaching-degree programmes), FSB = subject-specific provisions, SFB = list of modules

Other: A = thesis, LV = course(s), PL = assessment(s), TN = participants, VL = prerequisite(s)

Conventions

Unless otherwise stated, courses and assessments will be held in German, assessments will be offered every semester and modules are not creditable for bonus.

Notes

Should there be the option to choose between several methods of assessment, the lecturer will agree with the module coordinator on the method of assessment to be used in the current semester by two weeks after the start of the course at the latest and will communicate this in the customary manner.

Should the module comprise more than one graded assessment, all assessments will be equally weighted, unless otherwise stated below.

Should the assessment comprise several individual assessments, successful completion of the module will require successful completion of all individual assessments.

In accordance with

the general regulations governing the degree subject described in this module catalogue:

 ASPO2015

associated official publications (FSB (subject-specific provisions)/SFB (list of modules)):

This module handbook seeks to render, as accurately as possible, the data that is of statutory relevance according to the examination regulations of the degree subject. However, only the FSB (subject-specific provisions) and SFB (list of modules) in their officially published versions shall be legally binding. In the case of doubt, the provisions on, in particular, module assessments specified in the FSB/SFB shall prevail.
The subject is divided into

### Contents

History, applications and properties of robots, direct kinematics of manipulators: coordinate systems, rotations, homogenous coordinates, axis coordinates, arm equation. Inverse kinematics: solution properties, end effector configuration, numerical and analytical approaches, examples of different robots for analytical approaches. Workspace analysis and trajectory planning, dynamics of manipulators: Lagrange-Euler model, direct and inverse dynamics. Mobile robots: direct and inverse kinematics, propulsion system, tricycle, Ackermann steering, holonomes and non-holonomic restrictions, kinematic classification of mobile robots, posture kinematic model. Movement control and path planning: roadmap methods, cell decomposition methods, potential field methods. Sensors: position sensors, speed sensors, distance sensors.

### Intended learning outcomes

The students master the fundamentals of robot manipulators and vehicles and are, in particular, familiar with their kinematics and dynamics as well as the planning of paths and task execution.

**Contents**

1. Overview  
2. Dynamics of charged particles in magnetic and electric fields  
3. Elements of space plasma physics  
4. Sun and heliosphere  
5. Acceleration and transport of energetic particles in the heliosphere  
6. Instruments for measuring energetic particles in space.

**Intended learning outcomes**

The students possess a fundamental knowledge about space physics and, in particular, the description of the dynamics of charged particles in the heliosphere and in space. They are familiar with the relevant parameters, their theoretical formulation and the methods to measure them.

Contents
Control engineering or control systems engineering is an engineering discipline that applies automatic control theory to design systems with desired behaviors in control environments. The practice uses sensors and detectors to measure the output performance of the process being controlled; these measurements are used to provide corrective feedback helping to achieve the desired performance. In this course, students obtain a first impression of system modelling of linear systems.

Intended learning outcomes
In this lecture the students should learn how to describe linear systems (differential equations or state space models). Using the above descriptions, linear systems are analysed in order to control vagaries in system output using feedback obtained from different sensors. Proportional, Differential and Integral controllers and their inner workings will also be learnt by the students. Control laws will be solved manually (on-paper) as well as in simulations using Matlab/SciPy.

### Contents

The topics of this course cover the broad specturm that is needed for programming satellite systems. This includes close-to hardware programming as well as high level topics such as virtual machines and concurrency. Algorithms and data structures form the frame, where the special topics of computer science for space engineering are taught.

### Intended learning outcomes

In this lecture the students should learn advanced concepts of computer science. In addition to low-level programming and programming in C and C++, object oriented syntax and semantics of programming languages and efficient data structures are in focus of the course. In practical programming tasks/assignments within this module, students will be made familiar with virtual machines, such that they are enabled to set up their own virtual machine for a satellite system.

---

**Contents**

Spacecraft System Analysis examines the design of spacecraft and launch vehicles, including the impacts of the atmosphere and the space environment on requirements and configurations. The principles and design aspects of the structure, propulsion, power, thermal, communication, and control subsystems are studied.

**Intended learning outcomes**

Students gain a general understanding of orbital mechanics & parameters and the subsystems of a spacecraft. This course handles the most important subsystems individually as listed in the table of contents. At the end of the course students will learn to translate mission requirements into orbit and subsystem definitions. Thermal and Mechanical qualification including testing for space is additionally covered.

### Contents
The guidance and control of spacecraft depend on reliable communication. Scientific data returned to earth are irreplaceable, or replaceable only at the cost of another mission. In deep space, communications propagation is good, relative to terrestrial communications, and there is an opportunity to press toward the mathematical limit of microwave communication with reliability as well as channel capacity in mind. Further, the effects of small changes in the earth’s atmosphere and the interplanetary plasma have small but important effects on propagation time and hence on the measurement of distance. This course presents a top-down approach to communications system design. The course will cover communication theory, algorithms and implementation architectures for essential blocks in modern physical-layer communication systems (antenna, coders and decoders, filters, multi-tone modulation, synchronization sub-systems).

### Intended learning outcomes
At the end of the course, students will have gone through the complete process of designing a telecommunication system for a spacecraft including the subsystems described in the table of contents. All systems involved in end-to-end telecommunication chain including principal components for implementation will be discussed during the course.

### Contents
Remote sensing refers to the use of satellite- or aircraft-based sensor technologies to detect and classify objects on Earth, including on the surface and in the atmosphere and oceans, based on propagated signals (e.g. electromagnetic radiation). It may be split into “active” remote sensing (i.e., when a signal is emitted by a satellite or aircraft and its reflection by the object is detected by the sensor) and “passive” remote sensing (i.e., when the reflection of sunlight is detected by the sensor).

### Intended learning outcomes
The students learn the basics of earth observation. They outline and explain the radiation path through the atmosphere to the object under investigation and back to the sensor. They emphasize essential characteristics of remote sensing data, sensors and platforms.

**Contents**

Students taking up this course are recommended to first complete Control Engineering in Space I. This course teaches advanced topics in control of dynamic systems specially related to space applications.

**Intended learning outcomes**

The students learn all necessary basics for the understanding of dynamic systems and their controllability by Kalman filters and their use in space applications. They are introduced to advanced controller and observer methods and realize the connections between the dual pairs controllability-observability and controller- and observer design as well as the relationship between Kalman filter as a state estimator and an observer.

Module title: Advanced Sensory Systems and Sensor Data Processing  

Abbreviation: 10-I=ASS-182-m01

Module coordinator: holder of the Chair of Computer Science VII  
Module offered by: Institute of Computer Science

ECTS: 5  
Method of grading: numerical grade  
Duration: 1 semester  
Module level: graduate

Contents

Advanced automation systems need instrumentation concepts with proprioceptive and exteroceptive sensors. The sensors can be active or passive and may be enclosed into an embedded system. Only complex sensor systems and clever sensor data processing procedures ensure the tasks of satellite systems are performed in a reliable fashion. After discussing in detail state-of-the-art sensors and sensor systems, the course focuses on sensor data processing for in orbit and for planetary applications.

Intended learning outcomes

Students will master modern sensor data acquisition systems with embedded processing and several advanced data processing concepts, like sensor data interpretation. Advanced state estimation methods will be discussed within localization and mapping and students will have to deal with linear, non-linear filters (Kalman Filter, Extended Kalman Filter, Unscented Kalman Filter, Particle Filter, etc.). Furthermore, students should be able to put novel research strands in this area like machine learning concepts into a scientific and technological perspective and should be aware about the advantages and disadvantages.

---|---|---
5 | numerical grade | --

Duration | Module level | Other prerequisites
---|---|---
1 semester | graduate | --

Contents

Aircraft trajectory optimization belongs to the mathematical field of optimal control. This means that the optimal control history and the optimal state history (and maybe other additional parameters) that minimize a given cost function for a given dynamic system need to be calculated. Thereby, all given initial and final boundary conditions as well as path equality and inequality constraints need to be fulfilled. This enables e.g. the calculation of noise minimal approach and departure trajectories for a given aircraft at a given airport considering the population distribution as well as any procedural requirements.

Intended learning outcomes

In this lecture the students should learn how to solve such optimal control problems beginning with the modeling of the required dynamic system as well as the cost and constraint functions. In the next steps on the one side theoretical optimality conditions are derived for simple examples and on the other side discretization techniques for the solution of realistic problems are introduced. Afterwards, methods for the solution of the resulting sparse parameter optimization problem are presented. Finally, other aspects related to the implementation are introduced.

#### Contents

A multidisciplinary aerospace project is being carried out. It covers areas such as mechanical components, electronics and software as well as theoretical aspects and algorithms from the corresponding project topic. Current and relevant topics from the research will be worked out. Students should plan, carry out and control their work. In the end, a fully functioning system should be developed. The complete work and its results are documented by means of a written document and presented in a final presentation.

#### Intended learning outcomes

Students learn to work independently on a scientific project and develop a working system at the end of this period.

Contents

On-board payload data processing encompasses the data acquisition, transfer, storage, data compression or reduction and transmission to ground of instrument and sensor data. Quite often the amount of raw data generated by modern instruments is in excess of what can be transmitted to ground. This makes it necessary to use various signal processing and compression techniques to reduce the amount of data. It is equally important to have high speed data links, large on-board storage capabilities and digital signal processors available that are fast enough handle data in the range of gigabytes per second.

Intended learning outcomes

The student learns how to use an on-board computer (OBC) that is reliable, usually with redundant processors and to enable this processing power for other applications which support the spacecraft bus, such as attitude control algorithms, thermal control, failure detection isolation and recovery.

Contents
Introduction to the radar systems. Radar equation. Radar targets. Information from the radar signals. Fundamentals of coherent and incoherent radar systems. Configuration of the radar system and optimisation. Radar hardware incl. antennas, transmitter, receiver. Signal processing and data analysis. Radar systems applications for space research. This class introduces the student to the fundamentals of radar system engineering. The radar range equation in its many forms is developed and applied to different situations. Radar transmitters, antennas, and receivers are covered. The concepts of matched filtering, pulse compression, and the radar ambiguity function are introduced, and the fundamentals of radar target detection in a noise background are discussed. Target radar cross-section models are addressed, as well as the effects of the operating environment, including propagation and clutter. MTI and pulsed Doppler processing and performance are addressed. Range, angle, and Doppler resolution/accuracy, as well as fundamental tracking concepts, will also be discussed.

Intended learning outcomes
Student should have knowledge about physical principles, techniques and applications for radar systems.

### Contents
With the knowledge of basic programming, taught in introductory lectures, it is possible to realize simpler programs. If more complex problems are to be tackled, suboptimal results like long, incomprehensible functions and code duplicates occur. In this lecture, further knowledge is to be conveyed on how to give programs and code a sensible structure. Also, further topics in the areas of software security and parallel programming are discussed.

### Intended learning outcomes
Students learn advanced programming paradigms especially suited for space applications. Different patterns are then implemented in multiple languages and their efficiency measured using standard metrics. In addition, parallel processing concepts are introduced culminating in the use of GPU architectures for extremely quick processing.

CanSat (now known as FloatSat) is an interdisciplinary project designed not only for SpaceMaster students. It is designed for students with different backgrounds, e.g. in computer science, electronics, mechanical engineering, aerospace technology, physics, mathematics. A satellite project is an interdisciplinary project that requires knowledge and skills in this as well as in numerous other fields. CanSat is thus an ideal platform to combine all available skills in a single project. It covers the design and development of the space segment control software and the ground segment control software: telemetry and telecommanding in wireless communication: space segment - ground segment, electrical subsystem (energy, batteries), mechanical construction.

Intended learning outcomes
The students are able to build and integrate into the inside of the sphere the power unit, a control computer, a payload (camera) and attitude control devices: Gyros and reaction wheel of a pico satellite. The software of a CanSat "satellite" includes a real-time operating system (provided by us), commanding (immediate and time-tagged commands), telemetry (real time and history data), attitude control, power control, payload control, image processing and radio links communication. The ground segment ought to be able to generate and send telecommands and to get and (graphically) display the telemetry.

#### Duration
graduate

#### Contents
The summer school programme is for computer science students and students of aerospace technology-related study paths. The summer school addresses advanced students, Master's students and PhD candidates. The participants should be experienced in C/C++ and should have a good mathematical understanding. Part of the courses will be implementing a PID-control in C++. The lectures will include an introduction to information technology and devices in satellites, real time control systems, power supply in aeroplanes and satellites, control of quadcopters, space systems, space environment, orbital mechanics and attitude control, satellite communication, and mission operations.

#### Intended learning outcomes
The participants will learn about spacecraft system design, the related hardware and software. This course consists of lectures and opportunities for practical application of the topics covered.

#### Courses
(type, number of weekly contact hours, language — if other than German)
R (6)
Module taught in: English

#### Method of assessment
(type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 60 to 90 minutes)
- b) project (project documentation approx. 20 pages with presentation 30 to 45 minutes and subsequent discussion on the topic)
- c) oral examination of one candidate (approx. 20 minutes)
- d) oral examination in groups (groups up to 3 candidates, approx. 15 minutes per candidate)

Language of assessment: English

#### Allocation of places
--

#### Additional information
--

#### Referred to in LPO I
(examination regulations for teaching-degree programmes)

**Contents**

Selected topics in prototype design and implementation.

**Intended learning outcomes**

The students possess an advanced knowledge in the area of prototype design and implementation. They are able to understand solutions to complex problems in this area and to transfer them to related questions.

**Courses** (type, number of weekly contact hours, language — if other than German)

V (2) + Ü (2)  
Module taught in: English

**Method of assessment** (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

a) written examination (approx. 90 to 120 minutes) orb) project (project documentation approx. 20 pages with presentation 30 to 45 minutes and subsequent discussion on the topic) or cb) oral examination of one candidate each (approx. 20 minutes) or d) oral examination in groups (groups of up to 2 candidates, approx. 15 minutes per candidate)  
Language of assessment: English  
creditable for bonus

**Contents**

Independent research and work on a topic of satellite technology that was agreed upon with a lecturer.

**Intended learning outcomes**

The student is able to independently research a given subject in satellite technology and use the knowledge and methods that they acquired in the master courses. They are able to present the result of their work in an acceptable manner.

**Courses** (type, number of weekly contact hours, language — if other than German)

No courses assigned to module

Module taught in: English

**Method of assessment** (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

Master's thesis (50 to 100 pages)

Language of assessment: English
