Learning Outcomes

German contents and learning outcome available but not translated yet.

After having successfully completed their studies the graduates safulfil the following requirements:

- The graduates are highly skilled in abstract thinking, they are able to think analytically, they
 have a high problem-solving competence and are able to structure complex interrelations.
- The graduates have a wide overview of the different areas of physics and of connections to other sciences.
- They have profound knowledge of the mathematical and theoretical basics of physics as well as profound knowledge of the theoretical and experimental methods to gain new insights.
- They are able to transfer their abilities and expertise to research projects and know the current state of research in at least one speciality.
- With the help of primary literature, especially in English, they are able to become acquainted with the current state of research in a speciality.
- They have the ability to independently apply physical and mathematical methods to concrete experimental or theoretical physical tasks, to develop solutions and to interpret and assess the results.
- Even with incomplete information they are in a position to work independently on physical problems, applying scientific methods and following the rules of good scientific practice, and to present, assess and attend to the results and consequences of their work.
- They are able to discuss physical topics on the current state of research with other physicists and also to explain connections to physics to non-scientists.
- As physicists they are able to work in or even lead interdisciplinary and international teams with (natural) scientists and/or engineers in research, industry and economy.

Scientific qualification

- The graduates have profound knowledge of the mathematical, experimental and theoretical basics of physics
- The graduates can resort to profound knowledge of the theoretical and experimental methods to gain new insights
- The graduates have a wide overview of the different areas of physics
- The graduates know scientific areas adjacent to physics and realise interdisciplinary connections.
- The graduates have are highly skilled in abstract thinking, they are able to think analytically, they have a high problem-solving competence and are in a position to structure complex interrelations.
- The graduates transfer their abilities and expertise to research projects and know the current state of research in at least one speciality.
- The graduates are able to discuss physical topics on the current state of research with other physicists.
- The graduates are in a position to independently apply physical and mathematical methods to concrete experimental or theoretical physical tasks, to develop solutions and to interpret and assess the results.
- With the help of primary literature, especially in English, the graduates are able to become acquainted with the current state of research in a speciality.

Qualification to start a job

• Even with incomplete information the graduates are in a position to work independently on physical problems, following the rules of good scientific practice, and to present, assess and attend to the results and consequences of their work.

- As physicists the graduates are able to work in or even lead interdisciplinary and international teams with (natural) scientists and/or engineers in research, industry and economy.
- The graduates have the ability to independently apply physical and mathematical methods to concrete experimental or theoretical physical tasks, to develop solutions and to interpret and assess the results.
- The graduates are able to transfer their abilities and expertise to research projects and know the current state of research in at least one speciality.

Self-development

- Even with incomplete information the graduates are in a position to work independently on physical problems, and to present, assess and attend to the results and consequences of their work.
- The gradues know the rules of good scientific practice and take them into account

Qualification for social commitment

- The graduates are able to critically reflect scientific developments and to capture their impact on economy, society and environment. (technological impact assessment)
- The graduates have enlargened their knowledge concerning economic, social, natural scientific or cultural questions (to name but a few) and are able to attend to their views reasonably.
- The graduates are able to discuss physical topics on the current state of research with other physicists and also to explain physical correlations to non-scientists.
- The graduates have developed the willingness and ability to show their skills in participative processes and actively contribute to decisions.

Abbreviations used

Course types: $\mathbf{E} = \text{field trip}$, $\mathbf{K} = \text{colloquium}$, $\mathbf{O} = \text{conversatorium}$, $\mathbf{P} = \text{placement/lab course}$, $\mathbf{R} = \text{project}$, $\mathbf{S} = \text{seminar}$, $\mathbf{T} = \text{tutorial}$, $\ddot{\mathbf{U}} = \text{exercise}$, $\mathbf{V} = \text{lecture}$

Term: **SS** = summer semester, **WS** = winter semester

Methods of grading: **NUM** = numerical grade, **B/NB** = (not) successfully completed

Regulations: **(L)ASPO** = general academic and examination regulations (for teaching-degree programmes), **FSB** = subject-specific provisions, **SFB** = list of modules

Other: A = thesis, LV = course(s), PL = assessment(s), TN = participants, VL = prerequisite(s)

Conventions

Unless otherwise stated, courses and assessments will be held in German, assessments will be offered every semester and modules are not creditable for bonus.

Notes

Should there be the option to choose between several methods of assessment, the lecturer will agree with the module coordinator on the method of assessment to be used in the current semester by two weeks after the start of the course at the latest and will communicate this in the customary manner.

Should the module comprise more than one graded assessment, all assessments will be equally weighted, unless otherwise stated below.

Should the assessment comprise several individual assessments, successful completion of the module will require successful completion of all individual assessments.

In accordance with

the general regulations governing the degree subject described in this module catalogue:

ASP02015

associated official publications (FSB (subject-specific provisions)/SFB (list of modules)):

??-???-2026 (2026-??)

This module handbook seeks to render, as accurately as possible, the data that is of statutory relevance according to the examination regulations of the degree subject. However, only the FSB (subject-specific provisions) and SFB (list of modules) in their officially published versions shall be legally binding. In the case of doubt, the provisions on, in particular, module assessments specified in the FSB/SFB shall prevail.

The subject is divided into

Contents

Relational algebra and complex SQL statements; database planning and normal forms, XML data modelling; transaction management.

Intended learning outcomes

The students possess knowledge about data modelling and queries in SQL, transactions as well as about easy data modelling in XML.

Courses (type, number of weekly contact hours, language — if other than German)

 $V(2) + \ddot{U}(2)$

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

written examination (approx. 60 to 120 minutes).

If announced by the lecturer at the beginning of the course, the written examination may be replaced by an oral examination of one candidate each (approx. 20 minutes) or an oral examination in groups of 2 candidates (approx. 15 minutes per candidate).

Separate written examination for Master's students.

Language of assessment: German and/or English

creditable for bonus

Allocation of places

Contents

Intelligent agents, uninformed and heuristic search, constraint problem solving, search with partial information, propositional and predicate logic and inference, knowledge representation.

Intended learning outcomes

The students possess theoretical and practical knowledge about artificial intelligence in the area of agents, search and logic and are able to assess possible applications.

Courses (type, number of weekly contact hours, language — if other than German)

Contents

- Introduction
- Hilbert Spaces and Operators
- Quantum Mechanics
- Quantum States
- Quantum Circuit Elements
- Entanglement and Its Applications
- Quantum Key Distribution
- Quantum Channel
- Quantum Error Correction Coding
- Continuous-Variable Quantum Communications
- Further Topics

Intended learning outcomes

Students will

- develop a solid foundation in quantum information technology, including qubits, quantum gates, entanglement, and quantum measurements,
- learn about secure communications using quantum mechanics, including protocols like Quantum Key Distribution (QKD),
- gain familiarity with protocols such as quantum teleportation, superdense coding and error correction, and
- understand the effects of noise and decoherence in quantum communications and learn strategies to mitigate their impact.

Number-theoretic functions and their associated Dirichlet series resp. Euler products, their analytic theory with applications to prime number distribution and diophantine equations; discussion of the Riemann hypothesis, overview of the development of modern number theory.

Recommended previous knowledge:

Basic knowledge of algebra and number theory is assumed, such as can be acquired in the modules "Introduction to Algebra", "Introduction to Number Theory" and "Applied Algebra".

Intended learning outcomes

The student is acquainted with the fundamental methods of analytics number theory, can deal with algebraic structures in number theory and knows methods for the solution of diophantine equations. He/She has insight into modern developments in number theory.

6	nume	umerical grade				
Duration Module level		Other prerequisites				
1 seme	1 semester graduate					
Conter	Contents					

- 1) Image Acquisition: a) Motivation: History of Astronomical Imaging From the Eye to the Detector; b) Atmospheric Transmission: Ground Based vs. Space Based Imaging; c) Observing Techniques and Instruments; d) Optical Detector Types and CCD Properties; e) Imaging in Other Bands of the Electromagnetic Spectrum
- 2) Image Processing: a) Data Formats and Imaging Software; b) Basic Methods: Pixel Operations and Statistics;
- c) Basic Methods II: Image Operations; d) Image Reduction- / Calibration; e) Imaging in Color f) Image Processing Algorithms
- 3) Advanced Processing: a) FITS File Format; b) Image Reconstruction; c) Fourier Analysis; d) Speckle Interferometry; e) Maximum Entropy Methods; f) Interferometry; g) Image Classification, Machine Learning Methods
- 4) Outlook: a) Future Challenges: Scientific Questions / Instruments / Data Processing; b) Future Facilities Radio to Gamma-rays; c) Imaging in Other Scientific Fields

Intended learning outcomes

The aim of the module is to convey a fundamental understanding of imaging methods using examples from modern astronomy, incorporating measurements from ground- and space-based instruments. The students acquire the following qualifications: ability to process and interpret raw-image data, to perfom data reduction, image analysis, application and improvement of processing algorithms. The concepts and methods are not limited to the field of astronomy but applicable to many other areas.

Courses (type, number of weekly contact hours, language — if other than German)

V(3) + R(1)

Module taught in: German or English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 90 to 120 minutes) or
- b) oral examination of one candidate each (approx. 30 minutes) or
- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Language of assessment: English

Assessment offered: In the semester in which the course is offered and in the subsequent semester

ments	to bring	•	,		ntend to present new develop- ects are many-body localization	

Intended learning outcomes

The students learn how to describe condensed matter systems in presence of disorder and interactions from a theoretical point of view. This happens on the basis of analytical and numerical methods. Therefore, we envisage a smooth crossover of these students to the next step of becoming a researcher.

Formation of atmospheres. Planetary atmospheres in the solar system: chemical composition and thermodynamics. Radiative transfer and radiative balance. Fluid mechanics. Greenhouse effect. Climate Models: Equilibrium and Runaway. Physics of clouds. Electric and magnetic fields. Solar wind and interplanetary medium. Meteorites, asteroids, cosmic rays. Atmospheres of exoplanets.

Intended learning outcomes

Students have knowledge of the physics of planetary atmospheres, especially the Earth's atmosphere and near-Earth space. They are able to use the acquired knowledge in the planning of space missions and in the exploration of exoplanets. They are able to model the physical mechanisms of the terrestrial climate and interpret the effects of global warming.

Contonts					

Contents

Introduction to generic imaging concepts and physical imaging methods covering the most central aspects across all imaging modalities, including 1) the concept of Fourier imaging, 2) tomography (Radon-Transformation, central-slice- theorem), 3) the system theory of imaging systems, and 4) issues of image quality (point-spread function, modulation transfer function, spatial resolution, contrast, noise). During the course different advanced methods for image acquisition will be covered and a comprehensive overview of modern imaging modalities in biomedicine, material science and astrophysics will be given.

Intended learning outcomes

The students know the physical foundations of imaging methods and their applications. They understand the principles of image formation and are able to explain the different methods and to interpret simple images.

Conton	Contents					

Contents

- 1. Basics of the Standard Model of Particle Physics
- 2. Tests of the Standard Model in Low Energy Experiments and at High Energy Colliders
- 3. Neutrino Physics
- 4. Higgs Physics

A selection of topics from the following fields will covered:

- Phenomenology of Experiments at the LHC
- Particle Cosmology
- Extended Gauge Theories
- Models with Extended Higgs Sectors
- Supersymmetry
- Models with Extra Dimension of Space-Time

Intended learning outcomes

Familiarity with tests of the standard model and their limitations. Knowledge in the description of elementary particle phenomenology, in particular Higgs and neutrino physics. Ability to construct extensions of the standard model and understand how to test these extensions in low energy experiments, at high energy colliders and in cosmology.

- 1. Instability of Fermi systems in one dimension (1D)
- 2. Abelian bosonisation and Luttinger liquids (spinless fermions, correlation functions, models with spin, renormalization group, and the sine-Gordon model).

The below mentioned topics will be presented in different years:

- 3. Interacting fermions on a lattice (Hubbard model, t/J model, transport properties)
- 4. Bethe ansatz
- 5. Spin-1/2 chains
- 6. Disordered systems
- 7. Non-abelian bosonisation and the WZW model (Kac-Moody algebras, Sugawara construction, Knizhnik-Zamolodchikov equation, applications of the WZW model)

Intended learning outcomes

Familiarity with the peculiarities of one-dimensional (1D) electron systems. Acquisition of the theoretical tools to understand experimentally relevant features including disorder effects and transport in 1D.

Courses (type, number of weekly contact hours, language — if other than German)

V(3) + R(1)

Module taught in: English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 90 to 120 minutes) or
- b) oral examination of one candidate each (approx. 30 minutes) or
- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Language of assessment: English

Assessment offered: In the semester in which the course is offered and in the subsequent semester

History of Astronomy, Coordinates and Time Measurement, the Solar System, Exoplanets, Astronomical Scales, Telescopes and Detectors, Stellar Structure and Atmospheres, Stellar Evolution and their End Stages, Interstellar Medium, Molecular Clouds, Structure of the Milky Way, the Local Universe, the Expanding Universe, Galaxies, Active Galactic Nuclei, Large-Scale Structures, Cosmology.

Intended learning outcomes

The student is familiar with the modern astrophysical world view. He/She knows the methods and instruments of astrophysical research. He/She is able to plan and interpret his/her own observations. He/She is familiar with the physics and evolution of the most important astrophysical objects, e.g., stars and galaxies.

Contents

- 1. Density functional theory (DFT)
- 2. Wannier functions and localized basis functions
- 3. Numerical evaluation of topological invariants
- 4. Hartree-Fock and static mean-field theory
- 5. Many-body methods for solid state physics
- 6. Anderson impurity model (AIM) and Kondo physics
- 7. Dynamical mean-field theory (DMFT)
- 8. DFT + DMFT methods for realistic modeling of solids
- 9. Strongly correlated electrons

Intended learning outcomes

Theoretical treatment of the above topics complemented by hands-on tutorials to be held in the CIP-Pool. Familiarity with DFT software packages such as VASP or Wien2k and construction of maximally localized Wannier functions by projecting DFT results onto atomic orbitals using wannier9o. Knowledge how to obtain many-body solutions of the AIM and explore some of its limiting cases such as the Kondo regime. Ability to use impurity solvers based on exact diagonalization or continuous-time quantum Monte Carlo for the solution of the DMFT self-consistency equations.

Contents

This advanced course focuses on the details of modern computed tomography (CT), which is employed both in medical and industrial imaging applications. In addition to the technicalities of CT systems and their application to various tasks in engineering and medical science, this lecture emphasizes on the mathematics of "inverting the Radon transform". Starting with the simple Filtered Back Projection method which is applied to a variety of standard recording geometries (parallel, fan, cone, helix) the advanced course lays out the strategies for algebraic reconstruction techniques (ART) along with many types of regularization schemes which may accompany these methods. Students will have the opportunity to see how Radon data is recorded and how different error sources as well as the corresponding correction schemes influence the outcome of the reconstructed volume images. Finally the most common tools for volume image analysis are presented, such as distance transforms, watersheds, labelling and fiber orientation analysis.

Intended learning outcomes

The student know the concept of Computed tomography (CT) and its applications. From the formulation of the basic inverse problem posed by this technique the students are able to derive strategies for different numerical solutions, based on Fourier analysis and/or based on probability theory. Most importantly the students have a firm impression (first-hand experience) of the various sources of measurement errors in CT which can impede any well-prepared reconstruction.

	•	s in experimental or t	theoretical physics. Credi	ted academic achieve	ments, e.g. in case of change of	

Intended learning outcomes

The student posseses advanced knowledge meeting the requirements of a module in theoretical or experimental physics on Master's level in the study programme Nanostructure Technology. He/She commands knowledge in a current field in physics and insight into the measuring and calculating methods which are necessary to acquire this knowledge. He/She is able to classify and to link the learnt. He/She knows about fields of application.

 $\textbf{Courses} \ (\textbf{type}, \textbf{number of weekly contact hours, language} - \textbf{if other than German})$

V(3) + R(1)

Module taught in: English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 90 to 120 minutes) or
- b) oral examination of one candidate each (approx. 30 minutes) or
- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Conter	Contents					

This will usually be a course on quantum many particle physics approached by the perturbative methods using Green's functions

An outline could be:

- 1. Single-particle Green's function
- 2. Review of second quantization
- 3. Diagrammatic method using many particle Green's functions at temperature T=o
- 4. Diagrammatic method for finite T
- 5. Landau theory of Fermi liquids
- 6. Superconductivity
- 7. One-dimensional systems and bosonization

Intended learning outcomes

Working knowledge of the methods of quantum field theory in a non-relativistic context. Ability to study properties of Fermi liquids (and bosonic systems) beyond the one-particle picture. Acquisition of methods which are essential for the understanding the effects of interactions, including superconductivity and the Kondo effect.

- 1. Electrons in a periodic potential the band structure
- a. Electrical and thermal transport
- b. Bloch theorem
- c. Electrons
- 2. Semi-classical models of dynamic processes
- a. Electrical transport in partially and completely filled bands
- b. Fermi surfaces; measurement techniques
- c. Electrical transport in external magnetic fields
- d. Boltzmann-equations of transport
- 3. The dielectric function and ferroelectrics
- a. Macroscopic electrodynamics and microscopic theory
- b. Polarizability of solids, of lattices, of valence electrons and quasi-free electrons; optical phonons, polaritons, plasmons, inter-band transitions, Wannier-Mott excitons
- c. Ferromagnetism
- 4. Semiconductors
- a. Characteristics
- b. Intrinsic semiconductors
- c. Doped semiconductors
- d. Physics and applications of p-n junctions
- $e.\ Heterostructures$
- 5. Magnetism
- a. Atomic dia- and paramagnetism
- b. Dia- and paramagnetism in metals
- c. Ferromagnetism
- 6. Superconductivity
- a. Phenomena
- b. Models of superconductivity
- c. Tunnel experiments und applications

Intended learning outcomes

Knowledge of effects, concepts and models in advanced solid state physics. Familiarity with the theoretical principles and with applications of experimental methods.

<i>~</i> .						

- 1. Elements of quantum field theory:
 - Quantisation of the free field
 - Interactions
 - Renormalisation Group
 - Gauge Fields
 - Conformal Symmetry
 - Large N expansion
 - Supersymmetry
- 2. Elements of gravity
 - Manifolds, coordinate covariance and metric
 - Riemann curvature
 - Maximally symmetric spacetimes
 - · Black holes
- 3. Elements of string theory
 - Open and closed strings
 - Strings in background fields
 - Type IIB String Theory
 - D-Branes
- 4. The AdS/CFT correspondence
 - Statement of the correspondence
 - Near-horizon limit of D3-Branes
 - Field-operator correspondence
 - Tests of the correspondence: Correlation functions
 - Tests of the correspondence: Conformal anomaly
 - Holographic principle
- 5. Extensions to non-conformal theories
 - Holographic renormalisation group
 - Holographic C-Theorem
- 6. Applications I: Thermo- and hydrodynamics
 - Quantum field theory at finite temperature
 - Black holes
 - Holographic linear response formalism
 - · Transport coefficients: Shear viscosity and conductivities
- 7. Applications II: Condensed matter physics
 - · Finite charge density and Reissner-Nordström black holes
 - Quantum critical behaviour
 - Holographic fermions
 - Holographic superconductors
 - Entanglement entropy
- 8. Applications III: Particle physics
 - Gravity dual of confinement
 - · Gravity dual of chiral symmetry breaking
 - Quark-gluon plasma

Intended learning outcomes

Thorough understanding of the foundations of gauge/gravity duality and the ability to carry out basic tests. Working knowledge of essential applications. Knowledge of quantum mechanics and classical electrodynamics is a prerequisite for this course. Knowledge of quantum field theory and general relativity will be useful, however is not a prerequisite.

Courses (type, number of weekly contact hours, language — if other than German)

V(4) + R(2)

Module taught in: English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 90 to 120 minutes) or
- b) oral examination of one candidate each (approx. 30 minutes) or
- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Language of assessment: English

Assessment offered: In the semester in which the course is offered and in the subsequent semester

Module taught in: English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 90 to 120 minutes) or
- b) oral examination of one candidate each (approx. 30 minutes) or
- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Language of assessment: English

Assessment offered: In the semester in which the course is offered and in the subsequent semester

Contor	Contents					

Semiconductor Nanostructures are frequently referred to as 'artificial materials'. In contrast to atoms, molecules or macroscopic crystals, their electronic, optical and magnetic properties can be systematically tailored via changing their size. The lecture addresses technological challenges in the preparation of semiconductor nanostructures of varying dimensions (2D, 1D, oD). It provides the basic theoretical concepts to describe their properties, with a focus on optical properties and light-matter coupling. Moreover, it discusses the challenges and concepts of novel optoelectronic and quantum photonic devices based on such nanostructures, including building blocks for quantum communication and quantum computing architectures

Intended learning outcomes

Familiarity with the fundamental properties of semiconductor nanostructures as well as with their theoretical foundations. Knowledge of the technological methods to fabricate such structures, and of their applications to novel photonic devices.

Contor	Contents					

The lecture deals with the fundamental properties of semiconductors. It begins with an analysis of the crystal structure, leading to methods for describing band structures. These form a basis for discussing optical and electronic properties of monolithic semiconductors. It then turns to examining semiconductor heterostructures, and studies how these can be used to modify and design optical and electrical properties, especially in the case of lowered dimensionality systems. Examples are selected from current research activities.

Intended learning outcomes

To provide the student with a working knowledge semiconductors pertaining to crystal structure, symmetries, and band structures, as well as electrical and optical properties. This establishes a solid basis preparing him for the more targeted specially lectures in the program.

Conten	Contents					

5 Minimal models (critical statistical mechanics models (Ising, tricritical Ising, 3 state Potts model, restricted solid-on-solid models), correlation functions of the critical Ising model, fusion rules and the Verlinde algebra, Landau-Ginzburg description of minimal models, modified Coulomb gas method and its application to the Ising model, superconformal models)

6 Free bosons and fermions (mode expansions, twist fields, fermionic zero modes and fermion parity)

7 Free fermions on the torus (operator implementation of the partition function, vacuum energies, representations of Virasoro algebra, the modular group and fermionic spin structures, Virasoro characters, critical Ising model on the torus, Jacobi theta function identities)

8 Free bosons on the torus (Lagrangian formulation of the partition function, fermionization, orbifolds in general, S_1/Z_2 orbifold, Gaussian and Askhin-Teller models, duality between original and orbifold theories, marginal operators, the space of c=1 theories)

Intended learning outcomes

Acquisition of both practical and conceptional familiarity with the methods of conformal field theory. Basic understanding of critical phenomena, quantum field theory, and functional integration. Enhanced level of understanding in particular for students of theoretical physics by exposure to an ambitious method with significant applications in contemporary condensed matter physics.

Conter	Contents					

Conformal field theory (CFT), as developed in the 1980s, finds immediate applications in string theory and twodimensional statistical mechanics, where critical exponents and correlation functions for many models (Ising, tricritical Ising, 3-state Potts, etc.) can be calculated exactly. The physical idea is that the principle of scale invariance is elevated from a global to a local invariance, which for reasons of consistency amounts to invariance under conformal transformations. This, in turn, yields a rich and fascinating mathematical structure for two dimensional systems (either two space or one time and one space dimension). CFT has become relevant to many interesting areas of condensed matter physics, including Abelian and non-Abelian bosonization, quantized Hall states (where the bulk wave function is described in terms of conformal correlators, and the edge in terms 1+1 dimensional CFTs), the two-channel Kondo effect, fractional topological insulators, and in particular fault-tolerant topological quantum computing involving non-Abelian anyons (Ising and Fibonacci anyons, for example, owe their names to the fusion rules of the associated conformal fields.) A potential syllabus for the first term of the course is:

- o Introduction (scale and conformal invariance, critical exponents, the transverse Ising model at the self-dual point)
- 1 Conformal theories in D dimensions (conformal group, conformal algebra in 2D, constraints on correlation func-
- 2 Conformal theories in D=2 (primary fields and correlation functions, quantum field theory, canonical quantization and Noether's theorem, radial quantization and Polyakov's theorem, time ordering and functional integration, the free boson and vertex operators, conformal Ward identities)
- 3 The central charge and the Virasoro algebra (central charge, the Schwarzian derivative, the free fermion, (Abelian) bosonization, mode expansions and the Virasoro algebra, the cylinder geometry and the Casimir effect, inand out-states, highest weight states, descendant fields and operator product expansions, conformal blocks, duality and the bootstrap)
- 4 Kac determinant and unitarity (Verma modules and null states, Kac determinant formula, non-unitarity proof, conformal grids, minimal models in general)

Intended learning outcomes

Acquisition of both practical and conceptional familiarity with the methods of conformal field theory. Basic understanding of critical phenomena, quantum field theory, and functional integration. Enhanced level of understanding in particular for students of theoretical physics by exposure to an ambitious method with significant applications in contemporary condensed matter physics.

Nuclear magnetic resonance (NMR) is a quantum mechanical phenomenon that, through magnetic resonance imaging (MRI), has played a major role in the revolution in medical imaging over the last 30 years. Starting from the fundamentals of nuclear magnetic resonance (resonance principle, relaxation times, chemical shift) this course covers

- 1) the NMR signal theory and signal evolution (Bloch equations)
- 2) the principles of spatial encoding, magnetic resonance imaging (MRI) and corresponding imaging sequences and measurement parameters,
- 3) the concept of k-space and Fourier imaging,
- 4) the physical, methodological and technical possibilities and limitations of MRI. Finally, typical application fields of MRI in biomedical research, clinical imaging and non-destructive testing will be covered.

Intended learning outcomes

The students are familiar with the basics and the deepened aspects of NMR and MRI including the mathematical-theoretical description and the physical basics of modern MRI, MRI-instrumentation and image-formation/image-processing principles. The students gain a deep insight into the area of modern MRI and its interdisciplinary relations and applications.

The lecture conveys theoretical fundamentals, experimental techniques, and applications of nano-optics starting from the discussion of the focusing of light. Based on this, the fundamentals of modern far-field optical microscopy are discussed. In the following, the near-field optical microscopy is introduced and discussed. As a further basis, quantum emitters are introduced and their light emission in nano-environments is derived. Plasmons in 2D, 1D and o dimensions are introduced and discussed in detail. This finally leads to the concept of optical antennas.

Intended learning outcomes

Specific and in-depth knowledge of the topic of nano-optics. Familiarity with the basic theoretical description and applications of nano-optics as well as the current developments of the topic.

Contents					

Foundations of particle, atomic and molecular physics, low-temperature experiments and correlated systems, solid state properties, surfaces and interfaces. Experiments covering the topics x-ray radiation, nuclear magnetic resonance (NMR), quantum Hall effect, optical pumping and spectroscopy with visible light, Hall effect, superconductivity, lasers, solid state optics

Intended learning outcomes

Solid skills in performing an experiment and analyzing and documenting the experimental outcome. Basic knowledge of how to prepare a scientific publication and use state-of-the-art analysis systems and software. Knowledge of experimental methods, of using scientific publications, of performing and evaluating an experiment, and presenting and discussing the results in the form of a scientific publication.

Courses (type, number of weekly contact hours, language — if other than German)

P(3)

Module taught in: English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

practical examination

Students must successfully prepare, perform, document (lab notebook) and evaluate (in the form of a scientific publication) an experiment to be considered to have successfully completed this experiment. Students must successfully complete two experiments to be considered to have successfully completed this module. Detailed regulations are laid down in the respective module description.

Duration Module level Other pro		Other prerequisites	5			
1 semester graduate						
Contents						

Basic Properties of Superconductors and their Applications, Development of technological platforms, Methods of material science for calculating temperature profiles in superconductors. Overview of the phenomenology of conventional and unconventional superconductivity. Review of BCS theory and its applicability for different types of superconductors. Extension of Ginzburg-Landau theory to a quantum field theory formalism using Feynman diagrams and functional integrals. Theoretical formalism of Ward identities and response functions. Goldstone modes, phase fluctuations, and coupling to the electromagnetic field. Interpretation of the Meissner effect in terms of the Higgs mechanism. Interplay of magnetism and conventional/unconventional superconductivity. Discussion of current research topics and perspective on room-temperature superconductivity.

Intended learning outcomes

Acquisition of basic knowledge about superconductivity as a macroscopic quantum phenomenon. Profound understanding of unconventional superconductivity and its interplay with magnetism in the context of current research. Knowledge of BCS mean-field theory, the quantum-field theory methods necessary to extend BCS theory, as well as the Meissner effect and the Higgs mechanism. Basic understanding of unconventional superconductors and their fascinating connection with competing magnetic phases.

Duration Module level		Other prerequisite	Other prerequisites				
1 semester undergraduate							
Conter	Contents						

"Quantum mechanics 2" constitutes the central theoretical course to be taken within the international Master's program in physics. While the specific emphasis can be adjusted individually, the core topics that are supposed to be covered should include:

- 1. Second quantization: fermions and bosons
- 2. Band structures of particles in a crystal
- 3. Angular momentum, symmetry operators, Lie Algebras
- 4. Scattering theory: potential scattering, partial wave expansion
- 5. Relativistic quantum mechanics: Klein-Gordon equation, Dirac equation, Lorentz group, fine structure splitting of atomic spectra
- 6. Quantum entanglement
- 7. Canonical formalism

Intended learning outcomes

In-depth knowledge of advanced quantum mechanics. Thorough understanding of the mathematical and theoretical concepts of the listed topics. Ability to describe or model problems of modern theoretical quantum physics mathematically, to solve problems analytically or using approximation methods and to interpret the results physically. The course is pivotal to subsequent theory courses in astrophysics, high energy physics and condensed matter/solid state physics. The course is mandatory for all Master's students.

Contents					

The lecture addresses the fundamental transport phenomena of electrons in solids where Electron-electron interaction and the wave nature are the determining factors. This includes the diffusive and ballistic transport regime as well as the Coulomb blockade. Observations of electron interference effects, conductance quantization and the quantum Hall effect will be discussed. Thermoelectric properties of electronic system and the phenomenon of superconductivity will be examined as well.

Low dimensional electron systems and its quantum mechanical description are the basis of this lecture. Relevant material systems are semiconductor heterostructures as well as topological insulators, topological semimetals, and topological superconductors. The content will be guided by actual research results.

Intended learning outcomes

Working knowledge of basic transport experiments, its analysis and its interpretation which enables the student to discuss results critical.

Contents						

- 1) Motivation and Background
- a) History of radio astronomy
- b) The role and development of radio interferometry
- c) Applications of radio interferometry and scientific topics of special interest
- d) Summary of important concepts in radio astronomy
- II) Fundamental Concepts
- 1. Fourier optics
- a) The concept of telescope aperture
- b) Convolution and Fourier Theorems
- c) (Radio) telescopes as spatial filters
- 2. Interferometry
- a) The Michelson interferometer
- b) The two-element interferometer
- c) The visibility function
- d) The influence of limited bandwidth e) Spatial frequencies in interferometry
- f) Coordinate systems
- 3. Aperture Synthesis by Radio Interferometric Arrays
- a) The concept of (u,v) coverage
- b) Simple configurations and transit arrays
- c) Tracking arrays and Earth-rotation synthesis
- d) VLBI arrays
- e) Antenna separations and geometry
- 4. Receiver Response
- a) Heterodyne frequency conversion
- b) Interferometer sensitivity
- c) Sampling, weighting, gridding
- d) Bandwidth smearing
- c) Calibration
- 5.lmage reconstruction
- a) CLEAN and alternative imaging algorithms
- b) Image defects
- c) Seif calibration
- 6. Digital Beamforming
- II I. Special Applications and Challenges
- a) s.urveys and Wide-Field Imaging
- b) Very Long Baseline Interferometry
- c) Spectroscopy in Radio Interferometry
- d) Polarisation in Radio Interferometry
- e) Time-Domain Science in Radio Interferometry
- f) Low-frequency Challenges Interferometry
- g) Big Data in Radio Interferometry
- h) Interferometry and Geodesy
- IV) Technical realization: Current and Upcoming Radio Interferometers
- 1. Low-frequency arrays: LOFAR, GMRT, ASKAP, APERTIF/WSRT, LWA, MWA

- 2. Centimeter-Band Arrays: JVLA, MERLIN, ATCA, MeerKAT, VLBA, EVN, LBA, JVN, VERA, AVN
- 3. (Sub-) Mill imeter Arrays: ALMA, NOEMA, GMVA, EHT
- 4. The Future: SKA

Intended learning outcomes

The goal of the course is the transfer of knowwledge and competence in the radio interferometrical method, providing a foundation for independent research.

Concepts are taught in connection to practical examples from modern astronomy including recent measurements of radio interferometers.

Students shall gain the following specific competences: Understanding of the concept of radio interferometrical observations and their calibration.

Processing and interpretation of raw data. data reduction and analysis, applications and understanding of established algorithms.

Handling of large data volumes. The course makes use of general concepts and teaches special programming concepts that are of wide use beyond astronomy.

Courses (type, number of weekly contact hours, language — if other than German)

V(3) + R(1)

Module taught in: English

Method of assessment (type, scope, language — if other than German, examination offered — if not every semester, information on whether module can be chosen to earn a bonus)

- a) written examination (approx. 90 to 120 minutes) or
- b) oral examination of one candidate each (approx. 30 minutes) or
- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original examination date at the latest.

Language of assessment: English

Assessment offered: In the semester in which the course is offered and in the subsequent semester

Conten	Contents					

This course is complementary to the discussion of Wilson's renormalization group (RG) as covered in the course "Renormalization Group and Critical Phenomena" (11-CRP). This course focuses on the diagrammatic formulation of RG flow equations and its relation to diagrammatic perturbation expansions. For interacting fermion systems, this is of particular relevance in the context of the functional renormalization group. A possible outline of the course is:

- 1. Wilson's RG
- 2. Path integral formulation of interacting fermions
- 3. Bethe-Salpeter-equation
- 4. RG flow equations for the one-particle and the two-particle vertex
- 5. Comparison of flow equations with diagrammatic resummation schemes (such as the "random phase approximation")
- 6. RG flow equations for spin systems

Intended learning outcomes

Familiarity with modern diagram based techniques for interacting many-body systems. In-depth understanding of the theoretical framework addressing a range of phenomena in correlated electron systems including superconductivity, charge and spin density waves, and nematic instabilities.

Courses (type, number of weekly contact hours, language — if other than German)

- 1. Mathematical Foundations
- 2. Differential forms
- 3. Brief Summary of the special relativity
- 4. Elements of differential geometry
- 5. Electrodynamics as an example of a relativistic gauge theory
- 6. Field equations of the fundamental structure of general relativity
- 7. Stellar equilibrium and other astrophysical applications
- 8. Introduction to cosmology

Intended learning outcomes

Familiarity with the basic physical and mathematical concepts of general relativity. Mathematical understanding of the formulation in terms of differential forms. Understanding of the formal similarity between electrodynamics and the theory of general relativity, viewing both of them as gauge theories. Application of the theory to simple models of stellar equilibrium. First contact with elements of cosmology.

Duration Module level Other prerequisi			Other prerequisites	i	
1 semester graduate					
Contents					

PART 1 - Classical solutions

- 1. Vacuum solutions of Einstein's equation the Schwarzschild solution, Birkhoff's theorem, the Eddington-Finkelstein coordinates, Kruskal extension and eternal black holes, the Penrose diagram, conformal compactification and Carter-Penrose diagram
- 2. Gravitational collapse the Oppenheimer-Snyder solution
- 3. Charged and rotating black holes Cauchy horizons, ergosphere
- 4. ADM formalism energy and angular momentum
- 5. Black hole thermodynamics

PART 2 - Astrophysical observations of black holes

- 1. Spin and mass measurements of black holes
- 2. Black hole electromagnetism
- 3. Gravitational waves and their measurement

PART 3 – Quantum aspects of black hole

- 1. Introduction to QFT on curved spacetime: Rindler spacetime, Unruh effect
- 2. Derivation of Hawking radiation
- 3. Hawking's original formulation of the information paradox
- 4. The "holography of information" information paradox in AdS/CFT, the Page curve and Islands
- 5. Firewall, fuzzball, complementarity possible resolutions of information paradox
- 6. Wormholes and the factorization puzzle

Intended learning outcomes

This course plays a bridging role joining the basics on GR learnt in the GR I course and the active research directions in the fields of Astronomy, Astrophysics, General Relativity, String Theory and Gauge/Gravity Duality. Through this course, the students will gain sufficient commands over the applications of general relativity in connection with research directions in this area. This in turn will motivate them to pursue careers as a researcher in the aforementioned directions and help them to successful begin their Master and PhD projects.

In this lecture, the basic principles of spin transport are taught, with a particular emphasis on the phenomena of giant magnetoresistance and tunnel magnetoresistance. New phenomena from the fields of spin dynamics and current-induced spin phenomena are discussed.

Intended learning outcomes

Knowledge of basic principles of spin transport models and of applications of spin transport in information technology. Overview over the state-of-the-art findings in this field (giant magnetoresistance, tunnel magnetoresistance).

Contonts					

Basic theoretical principles of scanning force, tunneling, and near-field optical microscopy; basic principles of surface science; tip-sample interactions; design principles and material considerations; fundamentals of control engineering; measurement modes, e.g., contact and non-contact, Kelvin probe, friction force microscopy, etc; basic principles of processing and presenting microcopy data; measurement techniques and their application: lock-in, phase-lock loop, etc.

Intended learning outcomes

Student acquires specific knowledge in scanning probe microscopy. He/she knows the basic theoretical principles, is aware of basic design principles, knows pros and cons of various materials, and is familiar of measurement modes, contrast mechanisms, and their application. He/she is aware of recent development in the field.

Classical and quantum theory of the relativistic bosonic string, in particular the Nambu-Goto action and Polyakov action, Quantization of the closed bosonic string and emergent graviton, Quantum Lorentz invariance and critical dimension, Quantization of the open bosonic string, D-Branes, Gauge Fields and Yang-Mills Theories, Relativistic Conformal Field Theory, String Path Integral, BRST Quantization, String Interactions, Effective Actions and Gravity.

Intended learning outcomes

Familiarity with the classical and quantum theory of relativistic bosonic strings, in particular with the two classical actions for relativistic bosonic strings, the Nambu-Goto action and the Polyakov action. Ability to quantize the closed bosonic string and to understand the emergence of the massless graviton in the spectrum of the closed bosonic string. Knowledge of the the quantum Lorentz anomaly and the derivation of the critical dimension of the bosonic string. Understanding of the boundary conditions for the open string and its connection to D-branes. Knowledge of open string quantization and the spectrum of massless gauge fields, as well as of Yang-Mills fields for coincident branes. In-depth knowledge of relativistic conformal field theory, the string path integral and its BRST quantization and the calculation of string interactions. Thorough understanding of the low-energy effective actions in target space and the emergence of Einstein gravity.

Superstring Theories and M Theory, in particular a short introduction to bosonic string theory, the theory of fermionic fields and representations of clifford algebra in diverse dimensions, a review of supersymmetry in two and higher dimensions, the classical and quantum version of the Ramond-Neveau-Schwarz Superstring, type 2 A/B Superstrings, the Gliozzi-Scherck-Olive Projection and Space-Time Supersymmetry in 10 dimensions, the type 1 Superstring, heterotic string theories, anomaly cancellation and restrictions on gauge groups, dualities between the five superstring theories as well as their relation to M Theory in 11D, D-Branes and supersymmetric gauge theories, supergravity and the AdS/CFT Correspondence.

Intended learning outcomes

In-depth knowledge of supersymmetric string theories and M Theory. Familiarity with the main features of bosonic string theory, as well as withthe theory of fermionic fields and representations of Clifford algebra in different dimensions. Knowledge of supersymmetry in two and higher dimensions, as relevant for the understanding of superstring theory. Working knowledge of the classical and quantum version of the Ramond-Neveau-Schwarz Superstring. Understanding of the emergence of type II A/B Superstrings upon imposing the Gliozzi-Scherck-Olive Projection, which in particular enforces Space-Time Supersymmetry in 10D. Familiarity with the type 1 and heterotic superstring theories, as well as with anomaly cancellation in these theories and the restrictions it imposes on the allowed gauge groups. Knowledge of dualities between the five superstring theories as well as their relation to M Theory in 11D. Knowledge of the properties of D-Branes in type I and II superstring theories and the supersymmetric gauge theories they carry, of the supergravity actions in ten and eleven dimensional space-time and of the AdS/CFT Correspondence.

a) written examination (approx. 90 to 120 minutes) or b) oral examination of one candidate each (approx. 30 minutes) or c) oral examination in groups (groups of 3, approx. 30 minutes per candidate) or							

- c) oral examination in groups (groups of 2, approx. 30 minutes per candidate) or
- d) project report (approx. 8 to 10 pages) or
- e) presentation/talk (approx. 30 minutes).

If a written examination was chosen as method of assessment, this may be changed and assessment may instead take the form of an oral examination of one candidate each or an oral examination in groups. If the method of assessment is changed, the lecturer must inform students about this by four weeks prior to the original exami-

nation date at the latest. Language of assessment: English Assessment offered: In the semester in which the course is offered and in the subsequent semester Allocation of places **Additional information** Workload 240 h **Teaching cycle** Referred to in LPO I (examination regulations for teaching-degree programmes)

Duration Module level Other prerequisit		Other prerequisite	S		
1 semester graduate					
Conter	Contents				

The contents of this two-term course will depend on the choice of the lecturer, and may include parts of the syllabus which could alternatively be offered as "Quantum Many Body Physics" (11-QVTP).

A possible syllabus may be:

- 1. Band structure (Sommerfeld theory of metals, Bloch theorem, k.p approach and effective Hamiltonians for topological insulators (TIs), bulk-surface correspondence, general properties of TIs)
- 2. Electron—electron interactions in solids (path integral method for weakly interacting fermions, mean field theory, random phase approximation (RPA), density functional theory)
- 3. Application of mean field theory and the RPA to magnetism
- 4. BCS theory of superconductivity

Intended learning outcomes

In-depth knowledge of the topics listed above. In-depth understanding of the concepts involved and ability to apply the methods listed. This provides a thorough working knowledge of a large number of topics treated in the standard textbooks on theoretical solid state physics.

Conten	Contents					

Physics with modern particle physics detectors at the LHC and at the Tevatron. Discovery of the Higgs Boson. Determination of the W boson and Top Quark mass. Measurement of standard model parameters. Search for physics beyond the standard model.

Intended learning outcomes

Familiarity with the basic questions studied with a modern particle physics detector, and with modern data analysis techniques in particle physics. Ability to put results into context and to assess their systematic uncertainties.

Conton	Contonto				

Theoretical description of the Standard Model

Electroweak symmetry breaking through the Higgs mechanism

parity Violation

Bhabha scattering

Z-Line Shape and forward / reverse asymmetry

Higgs production and decay

Experimental setup and results of key experiments to test the Standard Model and for determining its parameters

Search for the Higgs boson

Intended learning outcomes

Students know the theoretical fundamental laws of the standard model of particle and the key experiments that have established and confirmed the standard model. They have basic knowledge in order to interpret experimental or theoretical results in the framework of the standard model can and knows its significance and limitations.

Camban	Contonto				

- 1. Semi-classical atom-field interactions
- 2. Interaction of atoms with quantized light fields and dressed-atom model
- 3. Master equation and open systems
- 4. Coherence and interference effects
- 5. Coherent light propagation in resonant media
- 6. Photon statistics and correlations
- 7. Quantum optics of many-body systems

Intended learning outcomes

Comprehensive understanding of phenomena involving light and its interaction with atoms at the microscopical level. Knowledge of density matrix formalism for quantum systems and the related mathematical concepts. In-depth understanding of quantum properties of light and their experimental signatures, including photon statistics and correlations. Knowledge of the theory of open systems and master equation description involving Lindblad superoperators. Understanding and modeling the role of coherence and interference in light propagation effects in resonant atomic media. Knowledge of cooperative effects in many-body systems: super- and subradiance, collective light shifts and their applications.
